3. Executive Summary

Mobile technologies are embedded in everyday life. Today, 89% of Australians own a smartphone¹ and the average Australian spends three hours every day using their smartphone - working, playing, connecting with family and friends. Australians also increasingly use smartphones for entertainment. Almost a quarter of smartphone users watch live TV on their phones at least once a week, and 23% stream film/TV series weekly.²

Mobile devices are also a vital tool for businesses and government. More than half of businesses report that mobile internet is important “to a major extent” for their activities.³

The technology continues to evolve quickly. Today smartphones are able to recognise fingerprints and voices, monitor heart rates, and even project augmented reality. And with the development of exponential technologies such as the internet of things (IoT), driverless cars, drones and virtual reality, mobile is increasingly becoming an integral part of society.⁴

The rapid adoption and evolution of mobile technologies comes with new challenges. There is ongoing debate about the possible overuse of mobile devices, particularly among young people, and the extent to which these devices connect us versus distract us. ⁴

For Yarra Ranges, the challenge of growing the economy through traditional infrastructure is now being exacerbated by the need to also facilitate the delivery of digital infrastructure to meet the expectations of industry, residents, community and visitors or risk being left on the wrong side of the digital divide.

Yarra Ranges engaged CartGIS to undertake independent mobile coverage testing and prepare a report to support an advocacy program aimed to target additional investment in the municipality and reduce the mobile black spots that impact the safety, welfare, and economic foundations of the municipality.

So how can the significant digital divide of this municipality be addressed? In a simplistic sense, the obvious question is to ask how many new mobile sites would it take to provide capital city comparative coverage? It would take significant new sites. The answer, however, is not that simple. Networks require local access (from the tower to the user) and connection to their core and the internet by backhaul. To improve from this current relatively low base, there is an urgent need to unlock significant funding in new and improved sites together with network improvements by all three major carriers.

The Federal Government’s Mobile Black Spots Program (MBSP) serves as one of the levers available to address the “divide”. Through the initial rounds, 8 new sites have been delivered or are committed for the Yarra Ranges.

The Yarra Ranges undertook an online survey to ascertain access to fixed internet services within the council boundaries. As part of this project, the Yarra Ranges requested residents and businesses within the municipal boundaries, that have fixed-line broadband services and/or mobile telephone and internet, to undertake their own voluntary-based internet speed and coverage testing and provide Yarra Ranges with the results.

The survey requested the respondents to answer a series of emergency management and safety questions.

- 98.4% of the respondents identified that they use internet to access emergency information during a bushfire or other event (e.g. flood, weather event or another emergency).
- 88.2% of the respondents identified that they use the Emergency Vic App to source emergency information.
- 8.8% of the respondents identified that they use the internet at their premise for safety or life critical devices. Duress or medical alarms accounted for 3.11% of respondents.

The survey requested the respondents to answer a series of internet usage and connectivity questions.

- **50% of respondents identified that they had a significant increase of internet usage during the COVID-19 pandemic.**

The testing of mobile coverage was undertaken to address the Yarra Ranges priority to provide an equitable communication network for all residents and businesses. The secondary initiative is aimed at ensuring that communication coverage is resilient to meet emergency management requirements. The key findings are:

- **In total there were 24,493 individual mobile coverage tests undertaken across the three carriers.**
- **When combined across all carriers, based on drive testing, 27% of the network is strong, 27% good, 21% is fair / usable. However, 25% of the network is unusable signal or no coverage.**
- Of the water tanks tested 24% (18) had unusable or no coverage.
- Of the emergency markers tested 23% (12) had unusable or no coverage.
- Of the other POI's tested 9% (10) had unusable or no coverage.
- There was a total of 493 bus stop locations tested. Of the those tested, 10% (47) had unusable or no coverage.

On Wednesday 9 June and Thursday 10 June 2021, parts of Victoria experienced a severe weather event with strong winds and heavy rains, causing trees and power lines to fall and several rivers to flood. By Friday 11 June, there were over 14,000 customers (households and business) in the Yarra Ranges that had suffered ongoing power outages. As a result, all localised NBN and mobile phone

communications services suffered prolonged network outages. It is estimated more than 90% of the communication outages were directly caused from the power outages.⁵

The June storm event in the Yarra Ranges exemplifies the risk posed by severe weather events and natural disasters to critical communications infrastructure such as the NBN and mobile phone networks. These outages not only pose imminent risk to life (inability to call 000 for immediate assistance, inability for emergency services to communicate across their workforce), but impact the recovery process and ongoing business continuity, causing local economic harm and disadvantage.

Based on this risk profile of climate change and disasters⁶, it is encouraged that Yarra Ranges Council undertake direct advocacy to ensure critical communications networks are hardened, to ensure power resilience, backhaul links are provided underground or utilise resilient wireless technologies, and the NBN network supports power resilience to vulnerable communities to ensure an “always connected” community.

⁵ Based on recent events like the 2020 bushfire, Black Saturday bushfires and Hurricane Katrina (USA), communication outages as a direct result of site damage usually equate to under 10% of total site outages.

⁶ AFAC Climate Change and Disasters, Key Messages and Resources | November 2020, P 5

4. Recommendations

Shortlisting priority locations where there are so many potential candidates is extremely difficult and will need active local involvement to shortlist based on local priorities.

The following framework and targets have been used as a filter to inform an initial priority list and associated proposed actions.

1. Mobile Black Spot Program

a) Residential and business communities not currently serviced “adequately” by at least one cellular telecommunication carrier with usable network quality – target 100%. Locations include:

- Beenak
- Hoddles Creek
- Reefton
- Steels Creek

b) Agricultural areas, to ensure smart farming technologies are available. Locations include:

- Beenak
- Dixons Creek
- Gilderoy
- Gladysdale
- Hoddles Creek
- Macclesfield
- Steels Creek

c) Tourism locations. Locations include:

- Acheron Way
- Cambarville
- Fernshaw
- Gembrook-Launching Place Rd (C424)
- Matlock
- Maroondah Hwy (B360) Healesville to Fernshaw
- Reefton Spur (C511)
- Shaw
- The Triangle
- Upper Yarra Dam
- Warburton-Woods Point Road (C511)
- Woods Point Road (C511) – East Warburton to Cambarville

d) Selected national parks and forestry sites. Locations include:

- Big Pats Creek
- Maroondah Reservoir
- Upper Yarra Dam

- e) Key sites in times of natural disaster – floods and fires. Locations include:
- Beenak
 - Hoddles Creek
 - Reefton
 - Steels Creek
 - Refer to other tourism locations (1.c)
- f) Identify acceptable distances without any mobile coverage on road networks e.g.target mobile coverage minimum every 10 kms.

2. Mobile Black Spot Program (MBSP) Policy and Advocacy

- a) Seek the continuation and expansion of the MBSP
- b) Consider ways to influence both criteria and connectivity mechanisms of the MBSP:
- Criteria - The criteria and target for the MBSP vary round to round. Earlier rounds (1-2) have led to some areas with comparatively higher levels of coverage, achieving funding reflective of providing an even spread of spending nationally on an eligible electorate basis. Electorates are based on population, which may impact Yarra Ranges disproportionately. Later and more recent rounds have focused on funding sites to promote regional and remote Australia. The criteria do not have linkages to resilience of mobile telecommunications infrastructure, in that it will not fund blackspots on the need for 'site hardening' alone.
 - Connectivity mechanisms – Currently, the MBSP supports macro towers and small cell sites to be delivered by a carrier. The Yarra Ranges municipality covers a significantly large geographic area, particularly for a metropolitan area, with residents located across many regional suburbs and townships. So while number of base stations and funding levels are distributed evenly by population, allocation doesn't necessarily address inequity across regional areas. There are several ways of adapting the program to deliver greater coverage using changes to policy/legislation or methods of delivering connectivity. If Yarra Ranges adds its voice to the national dialogue, significant advances may be made for the region without significant cost.

3. Carrier network upgrades – power resilience

The recent storm events have characterised the risk to critical communications network, particularly the Dandenong Ranges. The Yarra Ranges Council should:

- a) Work with carriers to seek power resilience upgrades at critical base stations and backhaul sites.
- b) Work with power distribution providers to ensure that critical base stations and backhaul sites are priorities for power distribution and resiliency.

4. Emergency internet provision

- a) Work independently of the carriers to provide.
 - Community-based internet services for vulnerable communities, at designated community locations, e.g. Powelltown Community Centre.
 - Community-based internet services for vulnerable communities, at designated neighbourhood safer places.
 - These services would need to be “always available” to ensure community use during an emergency. These services should be limited to accessing emergency sources only.
- b) Work with state and federal government to ensure the provision of internet services (e.g. SkyMuster satellite) for relief and recovery purposes at designated facilities.

5. Consider the development of a Strategic Action Plan

Successful regions and municipalities in Australia have used mobile coverage reporting to inform and implement a long-term strategic action plan covering the five key areas below.

- a) Target proportionate Mobile Black Spot Program Funding commensurate with the extensive black spots in the municipality. This involves sustained policy prioritisation and active political advocacy with federal and state governments
- b) Partner with the three carriers to identify their priorities and Yarra Ranges needs, focusing on:
 - Mobile Black Spot Funding locations
 - Mobile carrier backhauled resilience
 - Telecommunications site power resilience
 - Mobile carriers
 - NBN and other fixed broadband service providers
 - Local access network upgrades
- c) Partner with your regional industry and businesses to increase awareness, skilling, and demand for digital connectivity.
- d) Facilitate digital connectivity via emerging carrier and non-carrier systems⁷ that deliver wider coverage for the IoT and devices.
- e) Build and maintain local capability to underpin the strategic action plan. Invest in relevant experienced staff to provide a consistent core officer level and capacity to build relationships and deliver outcomes. Maintain regular updates to the current baseline to inform and drive the evolving priorities. Encourage communities and industry to undertake localised testing to build out the coverage picture for their own area.

⁷ Non-carrier systems are provided by parties that are not considered Telecommunications carriers. These may be private providers or public cooperatives.

6. Community education campaigns

Education is an important step to ensure telecommunications accessibility and community resilience. Community education, including small and medium business, should focus on the following areas.

- a) Awareness of the available NBN fixed broadband options in each locality.
- b) Awareness of how NBN fixed broadband technology differs.
- c) Awareness of the implications of power outages on NBN fixed broadband technology services and the resilience and/or redundancy measures the community should have in place.
- d) Education of the technological difference between NBN fixed broadband speed and Wi-Fi speed. Ensuring that the community understands the limitations that some Wi-Fi routers can have on network and speed performance.
- e) Awareness that the 5G rollout will not be directly linked to coverage enhancement in the Yarra Ranges, but rather improve network quality and performance.
- f) Awareness that the 5G mobile phone towers (base stations) have a smaller coverage footprint than that of 4G sites.
- g) Awareness of how bushfire smoke and certain climatic conditions can affect fixed wireless and SkyMuster satellite services and the resilience and/or redundancy measures the community should have in place.

5. Terms and Abbreviations

Term	Definition
3G	Short for third generation, is the third generation of wireless mobile telecommunications technology
4G	Is the fourth generation of broadband cellular network technology, succeeding 3G
5G	The fifth-generation cellular network technology
AMTA	Australian Mobile Telecommunications Association, the peak industry body representing Australia's telecommunications industry, including network operators, service providers, manufacturers, retailers and suppliers.
Backhaul	Carriers refer to the connection from local access (i.e. Mobile tower) to their core network backhaul. It is the link (fixed or wireless) from the mobile phone tower to other towers on the main network.
Black Spot	Term used to define where no signal is available for a carrier or carriers
CartGIS	CartGIS Pty Ltd, consultants
Carrier	Telecommunications carriers own network units that deliver carriage services including transmission infrastructure, cabling, wireless networks and satellite facilities. Under the Telecommunications Act 1997 they must be licenced with the Australian Communications and Media Authority.
DriveCell	Name of CartGIS' independent mobile network application for Android
GPS	Global positioning system
GSM	Global System for Mobile Communications
Hot spot	Term used to describe a location where a mobile carrier network has exceptionally high network performance for latency, download and upload scores.
IoT	Internet of Things. Describes the network of physical objects "things", including sensors, software, and other technologies that is used for the purpose of connecting and exchanging data with other devices and systems over the Internet.
Latency	Network delay, a measure of the time delay required for information to travel across a network
LTE	Long-Term Evolution, a telephone and mobile broadband standard
NBN	(Australia's) National Broadband Network
MCNO / MNO	Mobile [carrier] network operator. In Australia, these are Telstra, Optus and Vodafone (TPG).
Mobile towers	Major towers for mobile infrastructure including local access only or local access and microwave backhaul
MBSP	Mobile Black Spot Program a funding program managed by the Australian government to improve mobile coverage in non-metro Australia
Micro Cells or Small Cells	References smaller sized mobile infrastructure site for local access. Coverage is also typically smaller.
MVNO	Mobile Virtual Network Operator
Non-carrier	Non-carrier are networks and services provided by parties that are not considered Telecommunications carriers. These may be private providers or public cooperatives.
NPT	Network Performance Test. Mobile networks are often measured in terms of latency, download speed and upload speeds. In this report, NPT's capture the date time and locations as GPS coordinates together with the three network measures to capture and illustrate performance at that point in time.
Ping	Ping test is used to measure latency on a network
Power redundancy	When electrical equipment has an alternative or backup power source. This may be automatically or manually activated when required. This may include, but not limited to generators or batteries.
Power resilience (Hardening)	Electric power resilience addresses preparedness of the system and its ability to cope with various hazards that can disrupt electricity. This may include having sufficient battery back up to run during a mains power outage. Improving power resilience is also known as hardening.
RSSI	Received Signal Strength Indicator. RSSI is a measurement of the Radio Frequency / Radio Wave power present in a received radio signal at the mobile phone.
Yarra Ranges	Yarra Ranges Council or municipal boundary
Wireless	Wireless communication is the transfer of information or power between two or more points that are not connected by an electrical conductor

6. Introduction

Access to quality connectivity for mobile phone coverage and internet services has become a critical feature of contemporary communities around the world.

The COVID-19 pandemic has demonstrated the critical importance of the use of digital economy and the use of these underlying technologies, not only in Australia, but worldwide. The pandemic has resulted in the shutdown of schools, industry, businesses, services, retail, and hospitality nationally. This has required the rapid adoption of and pivoting to, digital technologies for business, government, industry, education, and medical services to facilitate remote practices and virtual face-to-face meetings.

Notwithstanding the rapid increase of connectivity for the pandemic, mobile connectivity, for phone calls and broadband, has become an engrained part of the community for well over a decade now. Connectivity, particularly cellular, is now regarded as a utility, with the expectation of uniform coverage and connectivity by residential, business, industry and public safety users and consumers. This user expectation has transformed from a 'want' to a 'need' as all market sectors embrace the rapid development of new technologies and require faster connectivity options.

The expectation has fuelled an economic requirement for the telecommunications carriers to provide coverage and capacity to meet the population requirements, often favouring the metropolitan and urban centres. This has resulted in inequities for regional and rural areas of Australia that are disadvantaged by the 'Digital Divide'⁸. There are virtually no mobile coverage black spots in our capital cities, or these locations are often first to experience the rapid deployment of the latest generation of connectivity. The regional areas however are considered to be on the wrong side of the 'Digital Divide'. Mobile phone black spots are significantly more prevalent in regional and remote Australia, with regional townships often having mobile phone technology a generation or two behind. The Figure 1 below, – Digital Divide for Australians], sourced from telecommunication carrier and Department of Communications data, highlights this digital divide for regional, rural, and remote Australians.

⁸ A Digital Divide in Rural and Regional Australia?, Dr Jennifer Curtin

https://www.aph.gov.au/About_Parliament/Parliamentary_Departments/Parliamentary_Library/Publications_Archive/CIB/cib0102/02CIB01

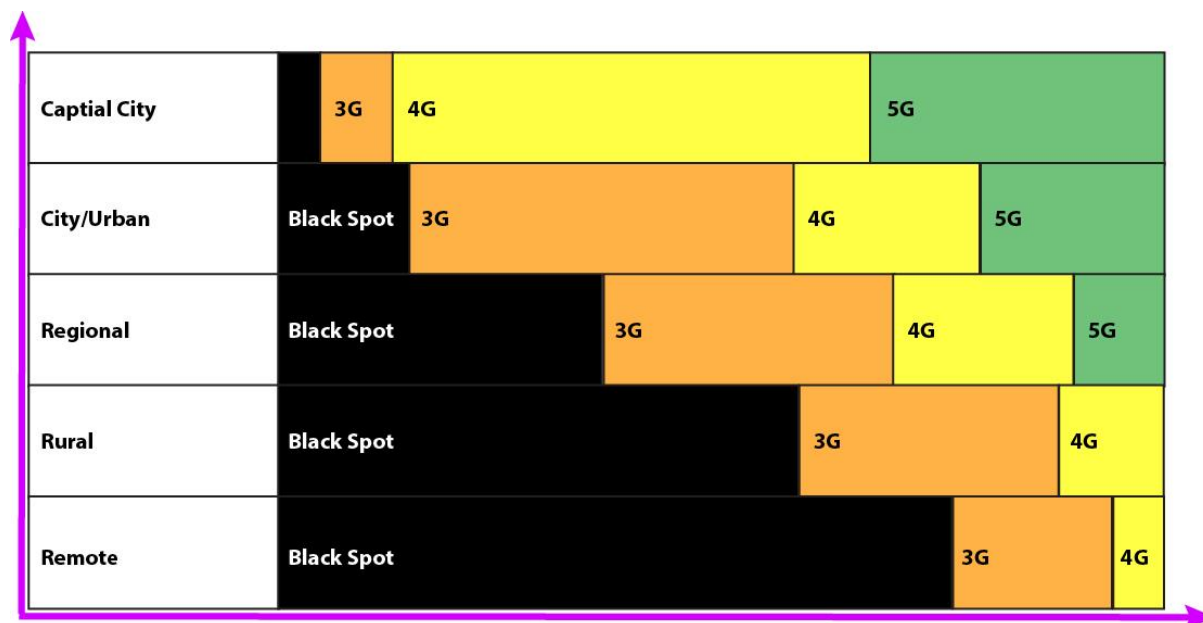

Figure 1 – Digital Divide for Australians⁹

According to the ABS, as of June 2018, there were about 34 million mobile services in Australia, and an estimated 17.9 million smartphones. As users, we are downloading more than ever on mobiles. In the three months ending June 2018¹⁰, 246,765 terabytes were downloaded.

For regions like Yarra Ranges, the opportunity is to find ways to partner with the three privately owned carriers to reduce the extent of Black Spot coverage. There are also opportunities to having existing sites upgraded and coverage expanded with current generation technology. Another avenue to improve coverage is to access current and future rounds of the federal Mobile Black Spot Funding Program.

For local government, managing the municipality in times of disaster or emergency, to providing a positive experience for visitors and delivering greater productivity for businesses, are a requirement for successful regions.

Yarra Ranges has engaged CartGIS to undertake independent mobile coverage testing and prepare a report including qualitative and quantitative supported research evidence. The report is aimed to support Yarra Ranges Council with advocacy when working with state and federal authorities to target initiatives, programs, and grants to enable investment in the municipality, aimed at reducing the mobile black spots and improving network resilience. The holistic aim of supporting these advocacy programs will ensure that best possible safety, welfare, and economic outcomes are met within the municipality.

Mobile phone technology and connectivity has rapidly developed in 25 years from sparse coverage aimed at in vehicle transceivers, servicing niche users, to comprehensive access and coverage for all. The demand for data is increasing at an exponential annual rate, which is facilitated by evolution of

⁹ Sourced from telecommunications carrier data and the Department of Communications.

¹⁰ <https://www.communications.gov.au/departmental-news/australians-are-downloading-more-ever>

4G and 5G technologies. The Figure 2 below, - The evolution of mobile networks], shows the rapid increase in mobile network technology.

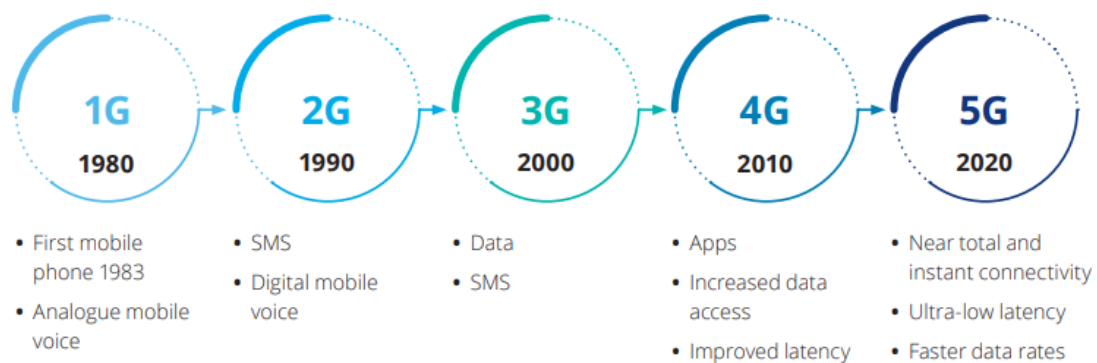

Figure 2 - The evolution of mobile networks

The importance of ensuring coverage and capacity within cellular networks is paramount as the demand for data doubles each year¹¹. Published statistics on the quantity of mobile towers is limited, however in December 2017 there were a total of 21,472 mobile sites around Australia¹² between three major carriers: Telstra, Optus and Vodafone. NBN and Telstra have the highest number of sites, accounting for over 36% of the total.

The need to look beyond mobile is ensuring that other broadband service providers are capable of providing reliable internet and data services. The main provider of these services in Australia is the NBN.

Australia's National Broadband Network was conceived in 2009 by the Labor Commonwealth Government. Since then, it has changed to ultimately what has been implemented as the final resolution. The original concept for the NBN was for near universal fibre to every premise in Australia. As the network build and implementation progressed the outcomes changed significantly. The earlier rollout saw fibre to premises as the single type of connection to the network, however this changed to a wide variety of other technologies later in the rollout due to the perceived cost of running Fibre to the Premise for everyone.

The original 2009 NBN aim of universal fast broadband speeds has been hampered by a "multi-technology mix" that has been adopted throughout the change of Governments during the NBN rollout time frame. This "multi-technology mix" approach has seen a gross inequity of the speeds delivered to residential and business customers throughout Australia¹³.

In December 2020, after eight years, the Commonwealth Government declared the NBN rollout complete.¹⁴ Under the National Broadband Network Companies Act 2011, the NBN needed to be

¹¹ <http://www.amta.org.au>

¹² Mobile phone base stations in Australia in 2017, by provider, <https://www.statista.com/statistics/792991/australia-number-of-mobile-towers-by-provider/>

¹³ Source: <https://techexec.com.au/?p=891>

¹⁴ <https://www.paulfletcher.com.au/media-releases/nbn-declared-built-and-fully-operational>

declared complete prior to December 31, 2020, or an extension needed to be made. It is also a necessary step before NBN Co can be privatised – although the government has stated it will not consider this during the current term of Parliament¹⁵. During this time, it is reported that the number of premises able to connect to the NBN is over 11.86 million premises.

In addition to the NBN, there are other broadband providers able to service residential and business customers. For the purpose of this report, these have been limited to providers that are reasonably achievable, and therefore have excluded technologies like leased or dark fibre, satellite services (other than SkyMuster and Starlink) or other infrastructure op type products.

7. Telecommunications Networks Background

7.1 NBN

The National Broadband Network (NBN) is an Australia-wide project funded by the Federal Government to provide all homes and businesses with a mandate for fast, reliable connection to the internet.

The NBN “multi-technology mix” connection types and the break-down of how many Australian homes and businesses use them, is listed below¹⁶.

- Fibre to the Premises (FTTP) - approx. 19%
- Fibre to the Node (FTTN) / Fibre to the Building (FTTB) - approx. 40%
- Fibre to the Curb (FTTC) - approx. 12%
- HFC Cable (HFC) - approx. 23%
- Fixed Wireless - approx. 4%
- Satellite / Sky Muster - approx. 1.5%

The following information has been sourced from NBN Co website as well as the Australian Registered Cabler Association. Images are provided from the NBN Co website.

Fibre to the Premises (FTTP)

FTTP is where fibre is run into the premise and terminated on a device supplied by NBN called Network Termination Device (NTD for short). The NTD is also referred to as the NBN Connection box. Each connection allows up to two different phone service providers and 4 different data service providers.

There are two sorts of FTTP rollouts. One is in new estates where fibre is the only technology installed to provide telephone and internet services to every home. The other one is in existing suburbs. Here the fibre being installed piggybacks on the existing copper telephone network.

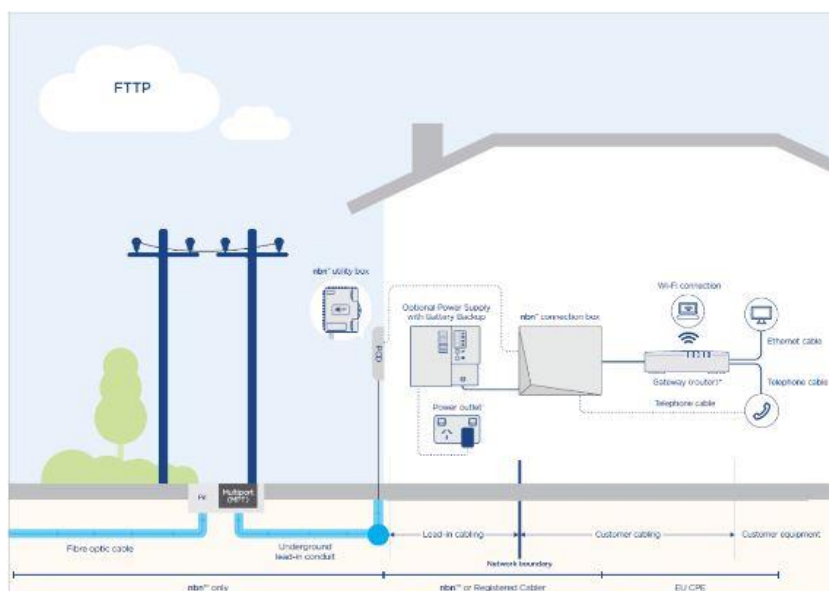

Figure 3 – FTTP

¹⁶ <https://www.nbnco.com.au/blog/features/nbn-101>

Fibre to the Building (FTTB)

FTTB is where fibre is installed to a building or apartment complex. It terminates at a node that converts the optical signal into one suitable for the existing copper cable in order to extend the broadband service to all apartments or offices.

The technology that helps this occur over the copper telephone wire is called VDSL, a faster version than the more common ADSL broadband. The VDSL modem will be very similar to the existing ADSL modems.

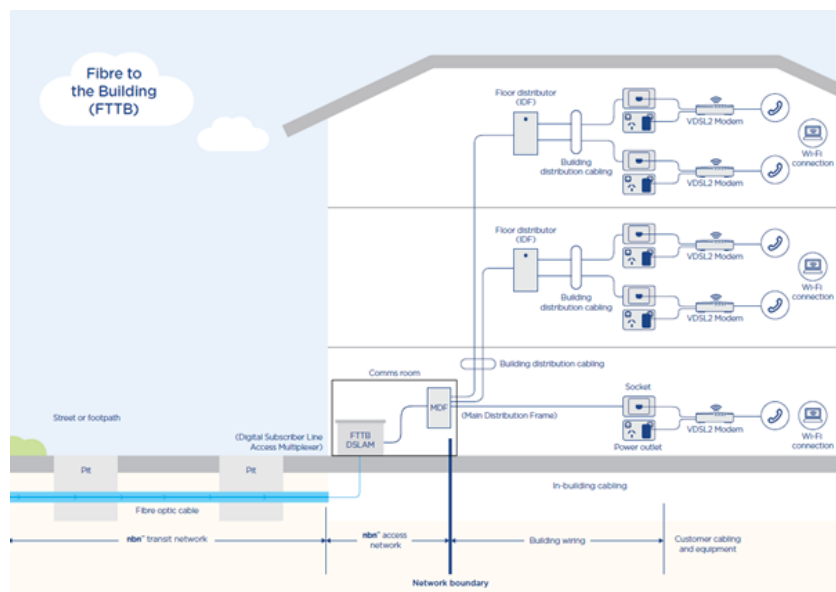

Figure 4 – FTTB

Fibre To the Node (FTTN)

FTTN is like FTTB except the node is installed outside the premises so it can service multiple premises. The ideal location would be next to an existing telecommunications pillar.

The technology from the node to the Multiple Dwelling Unit (apartment building, townhouses, etc) or Single Dwelling Unit (freestanding house) is VDSL. The connection and installation inside the dwelling will be the same as for ADSL. The node needs to be reasonably close to the dwelling, so the copper length is kept as short as possible.

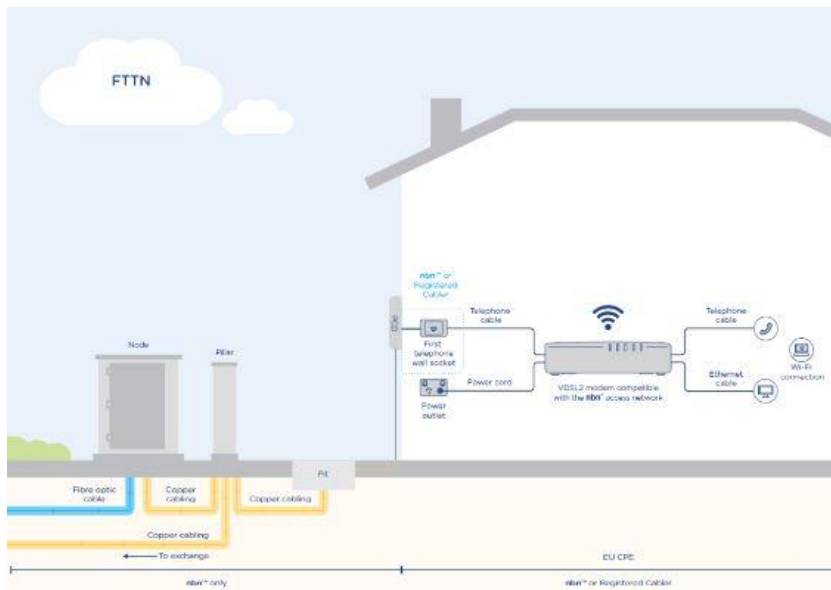

Figure 5 – FTTN

Fibre to the Curb (FTTC)

FTTC is the latest technology available bringing fibre optic cable all the way to the edge of the premises. The connection uses the existing copper lead into the building.

A FTTC connection is used in circumstances where fibre is extended close to your premises, connecting to a small Distribution Point Unit (DPU), generally located inside a pit on the street.

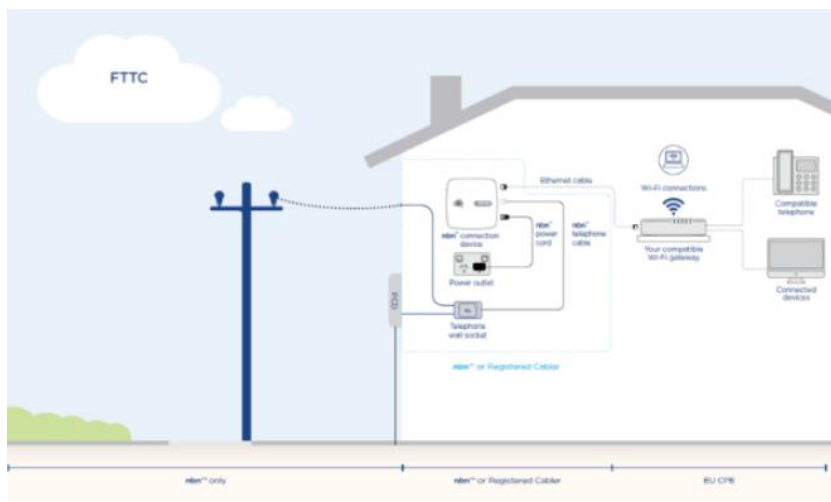

Figure 6 – FTTC

Hybrid Fibre Coaxial (HFC)

HFC is where high speed broadband is delivered over the existing pay TV network so the installation inside the home is the same as the existing cable modem. Using the latest technology, it is possible to deliver both broadband and telephony from the cable modem.

NBN will connect a PCD (Premises Connection Device) on the outside of the premises and then install a HFC cable wall outlet on the inside of the premises where they will connect the Network Termination Device.

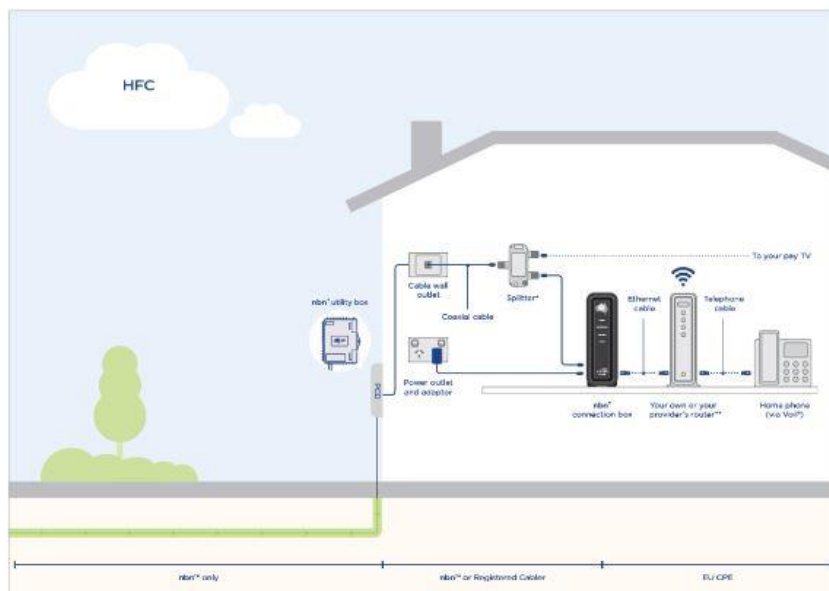

Figure 7 – HFC

Fixed Wireless

Fixed wireless is where NBN will install radio base stations like the ones used for mobile phones and then install an antenna and a fixed modem (NTD) in the premises. This NTD is only for broadband service, the telephony stays on the existing copper wires for the foreseeable future.

This connection is typically used in circumstances where the distance between premises can be many kilometres. Data travels from a transmission tower located as far as 14 kilometres, to an NBN outdoor antenna that has been fitted to the premises by an approved NBN installer.

Satellite / Sky Muster

The Sky Muster™ satellite service delivers the NBN network to homes and businesses in regional and remote Australia, via two satellites. The NBN will install a satellite dish connected to an NTD. Like fixed wireless this NTD will provide broadband services only.

It is important to note that NBN customers do not have the ability to select what technology they want to connect to the NBN with. This is decided by the NBN, dependant on what technology is available at the location of the premise.

NBN Plans

NBN plans are offered on four different speed tiers with an additional two offered for Fibre to the Premises customers.

Plans are offered from a telecommunications retailer and not directly from the NBN itself. The NBN are a network provider and wholesaler.

Speed Tier	Maximum Speed	Evening Speed
NBN 12 (Basic 1)	12Mbps	7Mbps
NBN 25 (Basic 2)	25Mbps	15Mbps
NBN 50 (Standard)	50Mbps	30Mbps
NBN 100 (Fast)	100Mbps	60Mbps
<i>Additional Fibre to the Premises</i>		
NBN 250 (Superfast)	250Mbps	215Mbps
NBN 1000 (Ultrafast)	1000Mbps	250Mbps

Table 1 – Available NBN Plans

The speeds in the table above are the maximum speeds you can get on these plans. However, the actual speeds obtainable at home or business will still be dependent on:

- The chosen NBN plan and provider.
- Congestion during peak hours (this is what is meant by 'evening speeds').
- Education of the technological difference between NBN fixed broadband speed and Wi-Fi speed. Ensuring that the community understands the limitations that some Wi-Fi routers can have on network and speed performance.

A list of NBN service providers can be found at

Residential - <https://www.nbnco.com.au/residential/service-providers>

Business - <https://www.nbnco.com.au/business/ict-channel-program/working-with-a-business-nbn-accredited-adviser/find-a-business-nbn-accredited-adviser>

7.2 Cellular (Mobile) Telecommunications

There are three mobile telecommunications providers (carriers) in Australia: Telstra, Optus, and Vodafone. Effective 29 June 2020, Vodafone Hutchison Australia Pty Limited was renamed TPG Telecom Limited. In this report, the name Vodafone is still used.

There is also a vast array of Mobile Virtual Network Operators (MVNO). MVNO's do not own the network as such but resell services from the main carriers directly to customers. There is a growing list of these providers. The estimated market share of these carriers is as shown in Figure 8.¹⁷

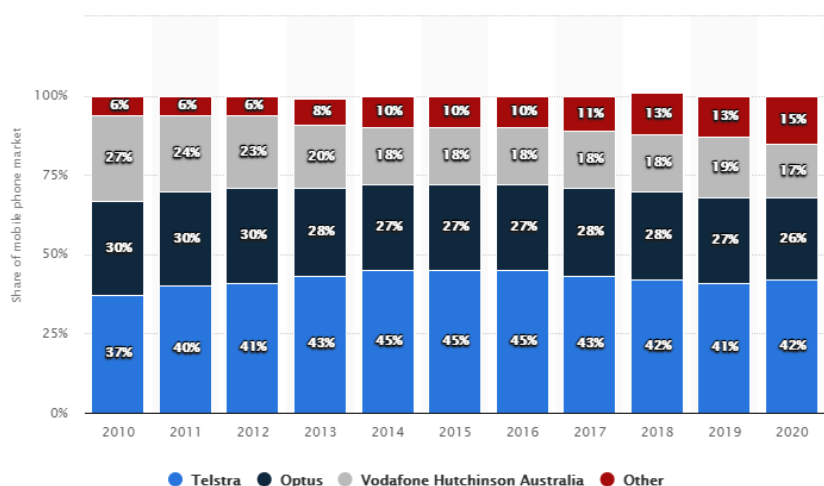

Figure 8 - Australian Mobile Market Share 2016

It is important to understand the major differences between Australia's three carriers and the technology they use. Mobile phone technology uses radio waves to carry data and voice. These radio waves reside in different frequency bands depending on the generation of the mobile phone technology (i.e. 3G, 4G or 5G). In general terms, the higher the frequency the faster and greater the data throughput. Newer technologies like 5G use more advanced modulation, which permits faster and greater data throughput than older generations on the same frequency. Furthermore, the higher the frequency the less coverage footprint it provides, and the less suitability for highly vegetated and mountainous areas. It is a fine balancing act for the carriers to engineer coverage to meet differing geographic environments.

Network	Technology
Telstra (3G)	Based on the GSM. Uses the frequency band of 850MHz. Telstra will shut down this service in June 2024.
Telstra 4G	Uses the frequency band of 1800MHz. This network provides 4G LTE data only services for most major cities and towns.
Telstra 4GX	Uses the frequency band of 700MHz. This network provides 4GX in all capital CBDs and selected suburban and regional areas. Better suited to regional areas than Telstra 4G.
Telstra Resellers (MVNO's)	Currently Boost Mobile and Belong is the only reseller of the full Telstra Next-G network. Refer to Table 3 - Mobile Telecommunications MVNO's.

¹⁷ <https://www.statista.com/statistics/488511/australia-mobile-handset-services-market-share>

Optus 3G	Based on the GSM. Operates on a dual frequency band of 900MHz and 2100MHz. The 2100MHz network provides 3G services to metro areas, and 900MHz provides 3G services to regional/rural areas. Optus will shut down their 2100MHz 3G network in April 2022. They have no formal plans to shut down their 900MHz 3G network at this stage.
Optus 4G	Currently operates on a dual frequency bands 1800MHz and 2300MHz. Most regional areas use the 1800MHz band.
Optus Resellers (MVNO's)	For the following networks please refer to Table 3 - Mobile Telecommunications MVNO's.
Vodafone 3G	Based on the GSM. Operates on a dual frequency band of 900MHz and 2100MHz, however most mobile phones only support 900MHz. Vodafone has no timeline for ceasing their 3G network.
Vodafone 4G	Operates on a three frequency bands, 850MHz, 900MHz and 2100MHz. Most metro areas are covered by 850MHz, with suburban and regional towns covered by 2100MHz, and 900MHz used for remote areas and townships.
Vodafone Resellers (MVNO's)	For the following networks please refer Table 3 - Mobile Telecommunications MVNO's.
5G	Telstra and Optus have commenced rollout this generation service in 2019, with Vodafone to follow in 2022. Like 4GX and 4G+, this is a data only service. Telstra has the greatest 5G coverage, however it is still limited.

Table 2 - Mobile Telecommunications Carriers and networks

The following is a list of all the MVNO's that operate in Australia, along with their host network.

Company	Host network	Website

Table 3 - Mobile Telecommunications MVNO's

7.3 Other Providers

In addition to connectivity from mobile telecommunications providers and the NBN, the other viable options for residential or small to medium business in Yarra Ranges are:

- Wireless Internet Service Providers (WISPs), and
- Starlink.

WISPS

Throughout Australia there is a growing development of private, non-NBN fixed wireless internet providers, who operate their own independent Wireless ISP networks.

WISPs use similar technology to NBN fixed wireless. Fixed wireless is where the service provider will install radio base stations like the ones used for mobile phones and then install an antenna and a fixed modem (NTD) in the premises. This NTD is only for broadband service, the telephony stays on the existing copper wires for now.

The following link contains information about these independent providers, not about the NBN Fixed Wireless service, or the Retail Service Providers (RSP) utilizing the NBN network. <https://birraus.com/alternative-fixed-wireless-providers/>

Starlink

Starlink is a satellite internet system owned by SpaceX that hopes to deliver high-speed internet across the globe by the end of 2021. Starlink is being pitched toward areas where connectivity has been challenging, such as rural and regional Australia.¹⁸

The major difference between Starlink satellite and traditional satellites is that they're 60 times closer to Earth. This means Starlink can deliver faster, more responsive connectivity than typically expected from a satellite internet service.

Starlink is already able to deliver service to Australians living in central Victoria and southern New South Wales but says there is "limited supply". The company says the service will expand across the country by December 2021.¹⁹

At present, Starlink is only able to provide internet service to ACMA "low and remote density areas". This covers the majority of Australia, except for Sydney, Brisbane, Melbourne, Adelaide, Perth, and the Gold Coast. The ACMA low and remote density area (that defines Starlink's coverage) vertically divides the Yarra Ranges and provides availability to the east of Launching Place on a longitudinal perspective. Please refer to Figure 9 – Starlink's licenced area for use in Yarra Ranges for a graphical representation.

Current Starlink plans are \$139 per month. There is an upfront \$709 in hardware fees, and \$100 in shipping and handling. Pre-order requires a fully refundable deposit of \$139. The service relies on the self-installation of the satellite dish using Starlink's smartphone app for direction ranging.

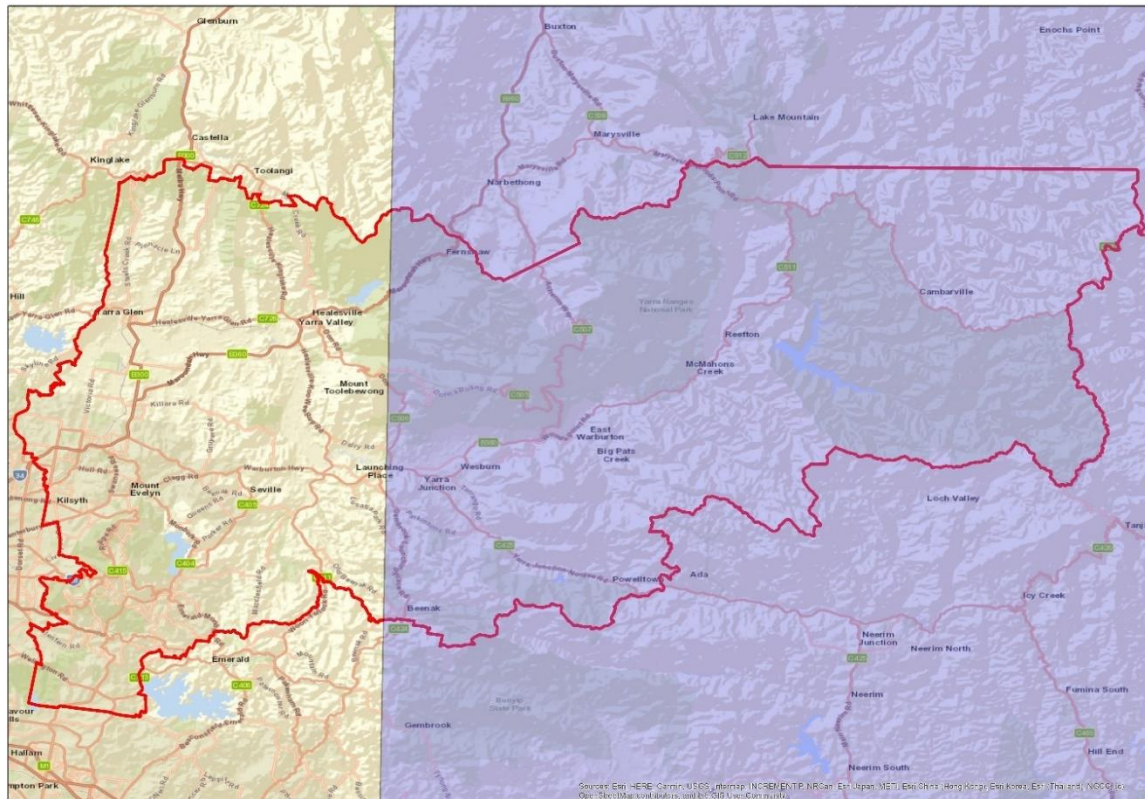

Figure 9 – Starlink’s licenced area for use in Yarra Ranges

8. Fixed Telecommunications Survey

The Yarra Ranges undertook an online survey to ascertain access to fixed internet services within the council boundaries. As part of this project, the Yarra Ranges requested residents and businesses within the municipal boundaries, that have fixed-line broadband services and/or mobile telephone and internet, to undertake their own voluntary-based internet speed and coverage testing and provide Yarra Ranges with the results.

There were 488 survey results in total with respondents' locations being listed as: home address 89.41%, a business address 3.29% and a home business 7.29%. Of the 70 council townships listed, only 15 localities were not represented.

8.1 Emergency Management and Safety

The survey requested the respondents to answer a series of emergency management and safety questions.

98.4% of the respondents identified that they use internet to access emergency information during a bushfire or other event (e.g. flood, weather event or another emergency).

88.2% of the respondents identified that they use the Emergency Vic App to source emergency information. The other sources are highlighted below in Figure 10 – Emergency App Usage.

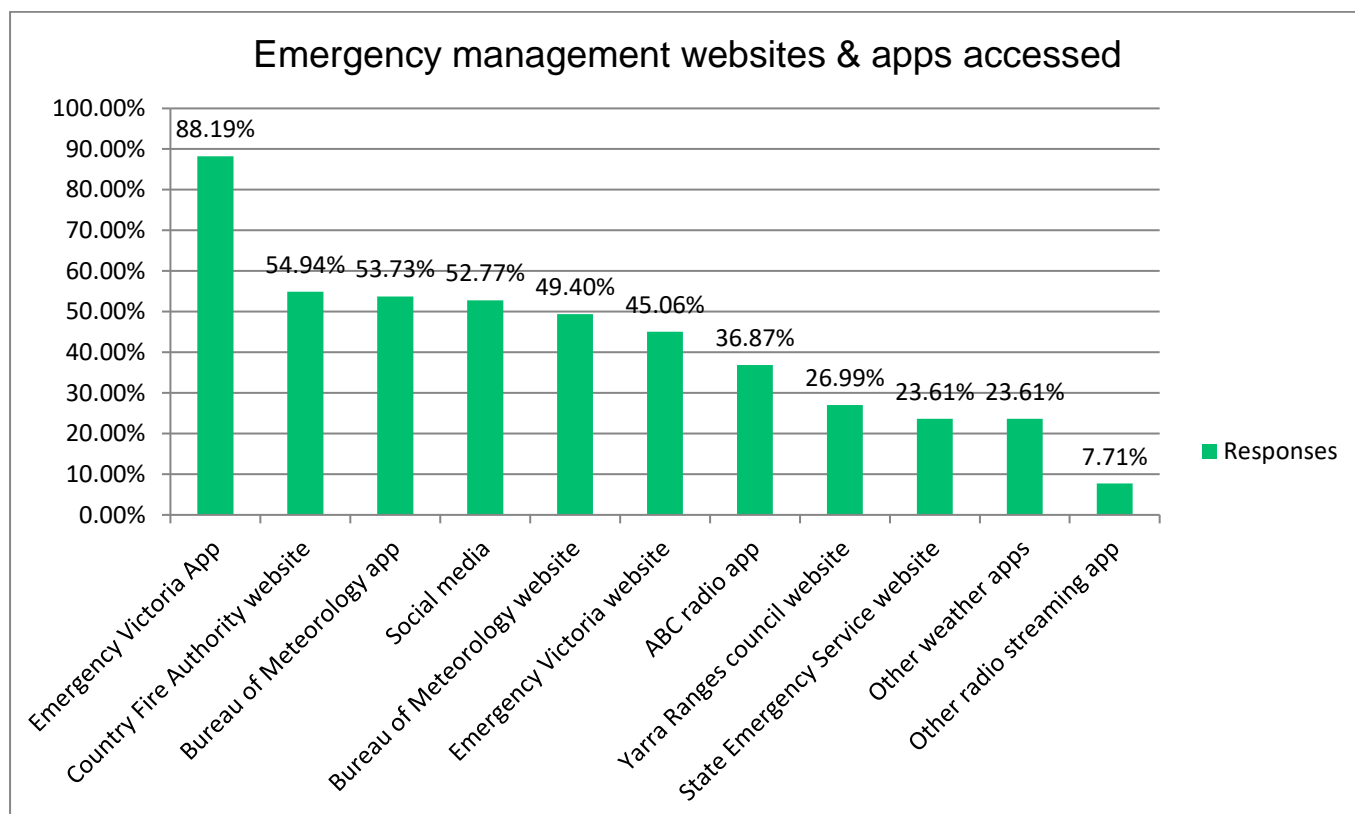

Figure 10 – Emergency App Usage

8.8% of the respondents identified that they use the internet at their premise for safety or life critical devices. Duress or medical alarms accounted for 3.11% of respondents.

8.2 Internet technology

The survey requested the respondents to answer a series of technology questions.

76% of respondents had fixed internet services, with a surprising 27% still having ADSL internet services connected. Only 3.5% of the survey respondents were using mobile broadband for dedicated internet at their home or work premises. Figure 11 – Fixed internet technology identifies the technology split.

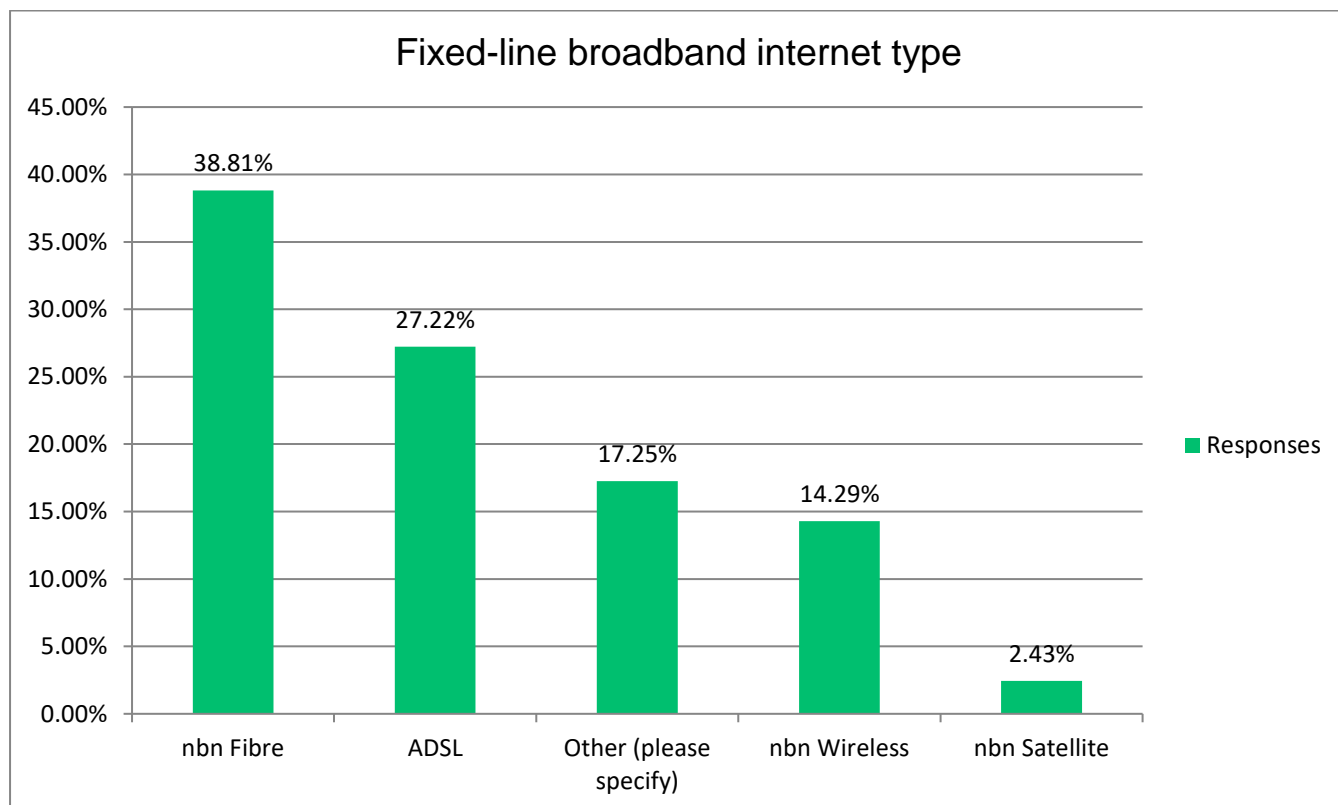

Figure 11 – Fixed internet technology

43.6% of respondents were using an associated fixed line telephone at their premise, using either VoIP or copper-based technology.

Of all respondents, the most popular uses of the internet were email (99.24%), web browsing (97.22%), online shopping (91.16%), social media (90.66%) and online communications (91.341%).

50% of respondents identified that they had a significant increase of internet usage during the COVID-19 pandemic. Only 1.5% of users reported a decrease in internet usage during the pandemic.

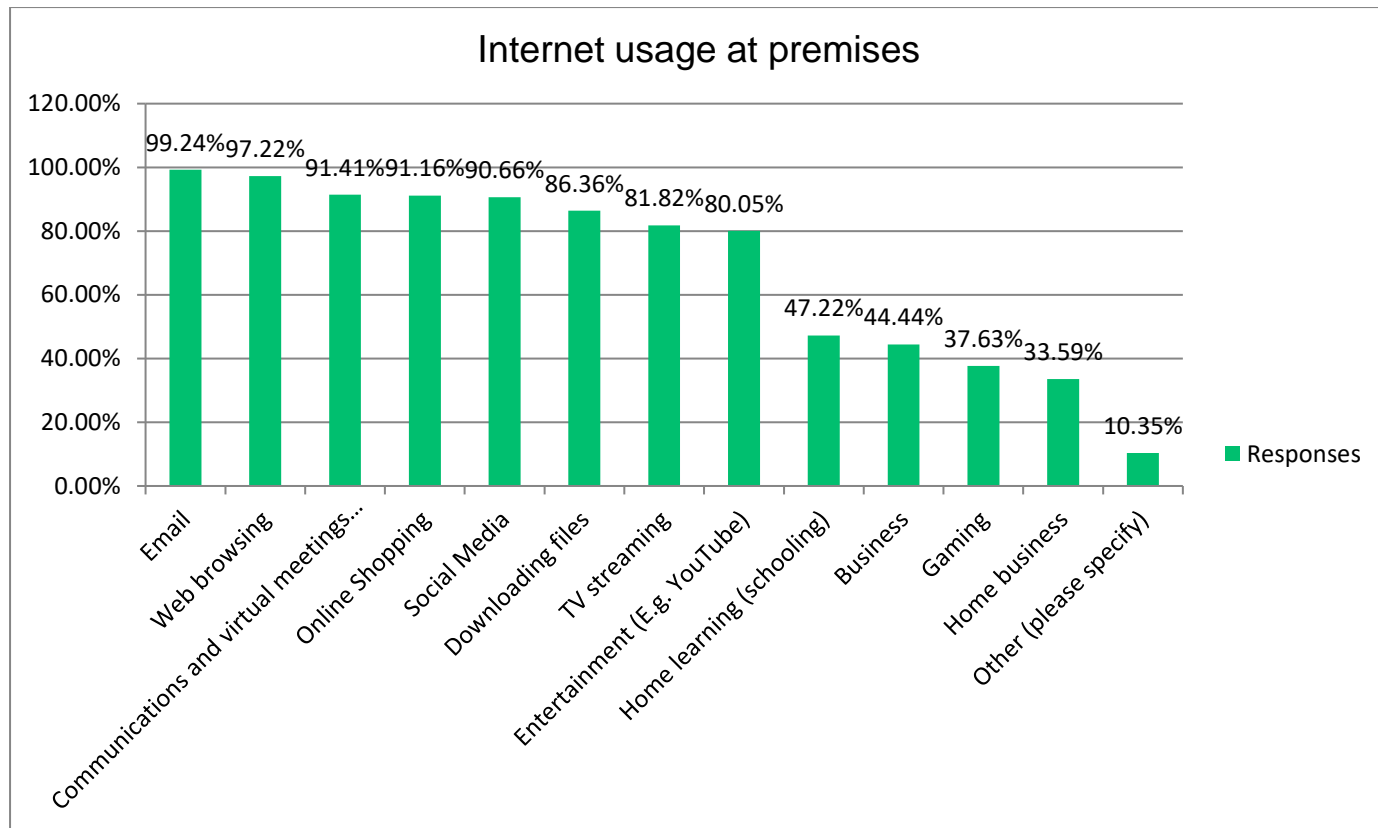

Figure 12 – Fixed internet uses

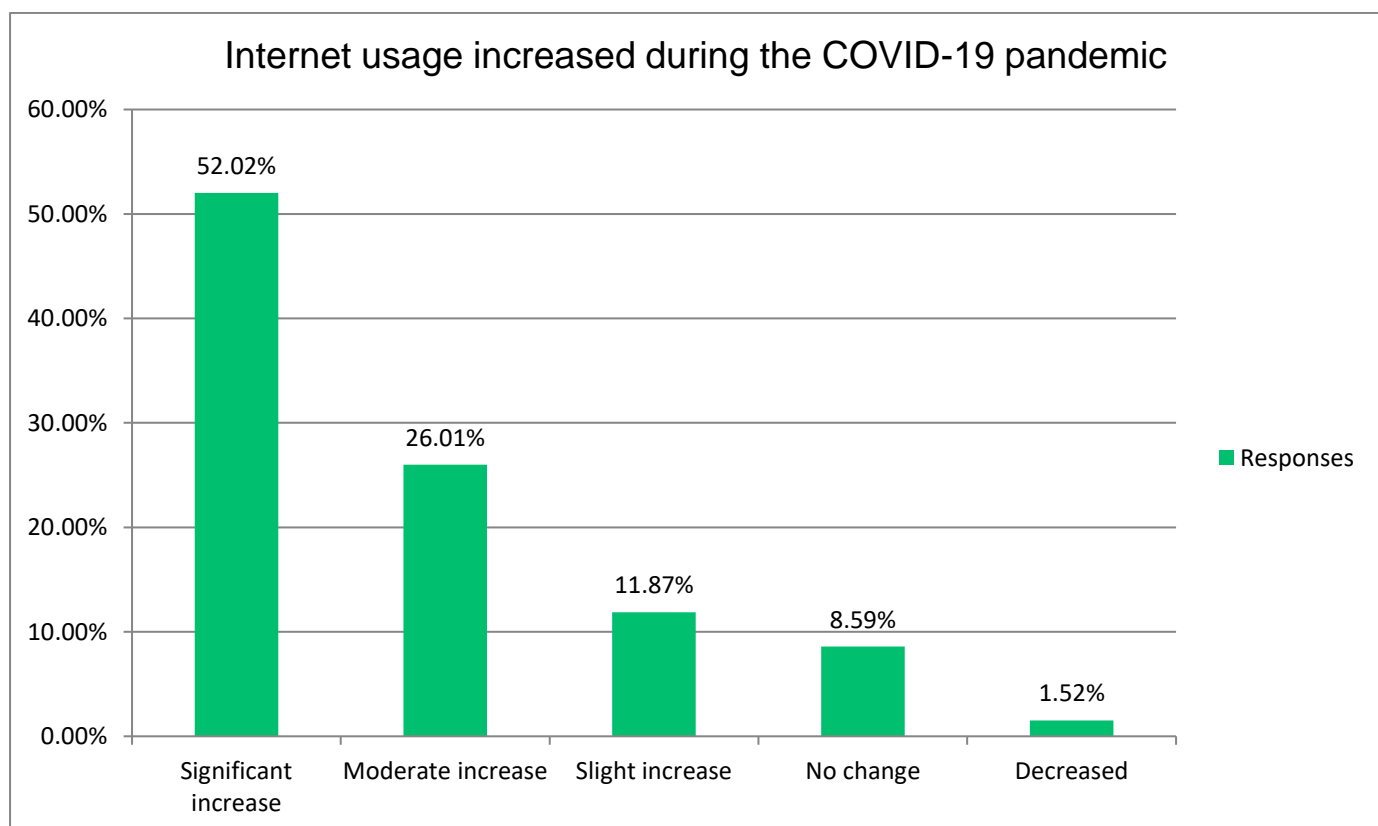

Figure 13 – Fixed internet usage during COVID-19

12.3 Speed Testing

The survey requested the respondents to undertake a fixed internet speed test.

Respondents were requested to:

- 1) Preferably undertake the test from a device that is connected to the router via a network cable (ethernet cable). This will ensure that your internet speed test is not affected by your Wi-Fi.
- 2) If you do not have a device that can be directly connected to your router, undertake the test using Wi-Fi, however, stand as close to your wireless router as possible.
- 3) Avoid times when automatic downloads may be occurring (e.g. software updates)
- 4) Test your internet download and upload speeds from the Ookla® Speed test website.

Only 25% of respondents undertook the test on a fixed connection to the router. The remainder undertook the test using Wi-Fi. Tests were undertaken at 61 Yarra Ranges localities. From the 488 survey responses there were over 1143 individual speed tests carried out.

The average and median test speeds for the survey locations are displayed in the graph below, Figure 14 – Fixed internet average and median test speeds.

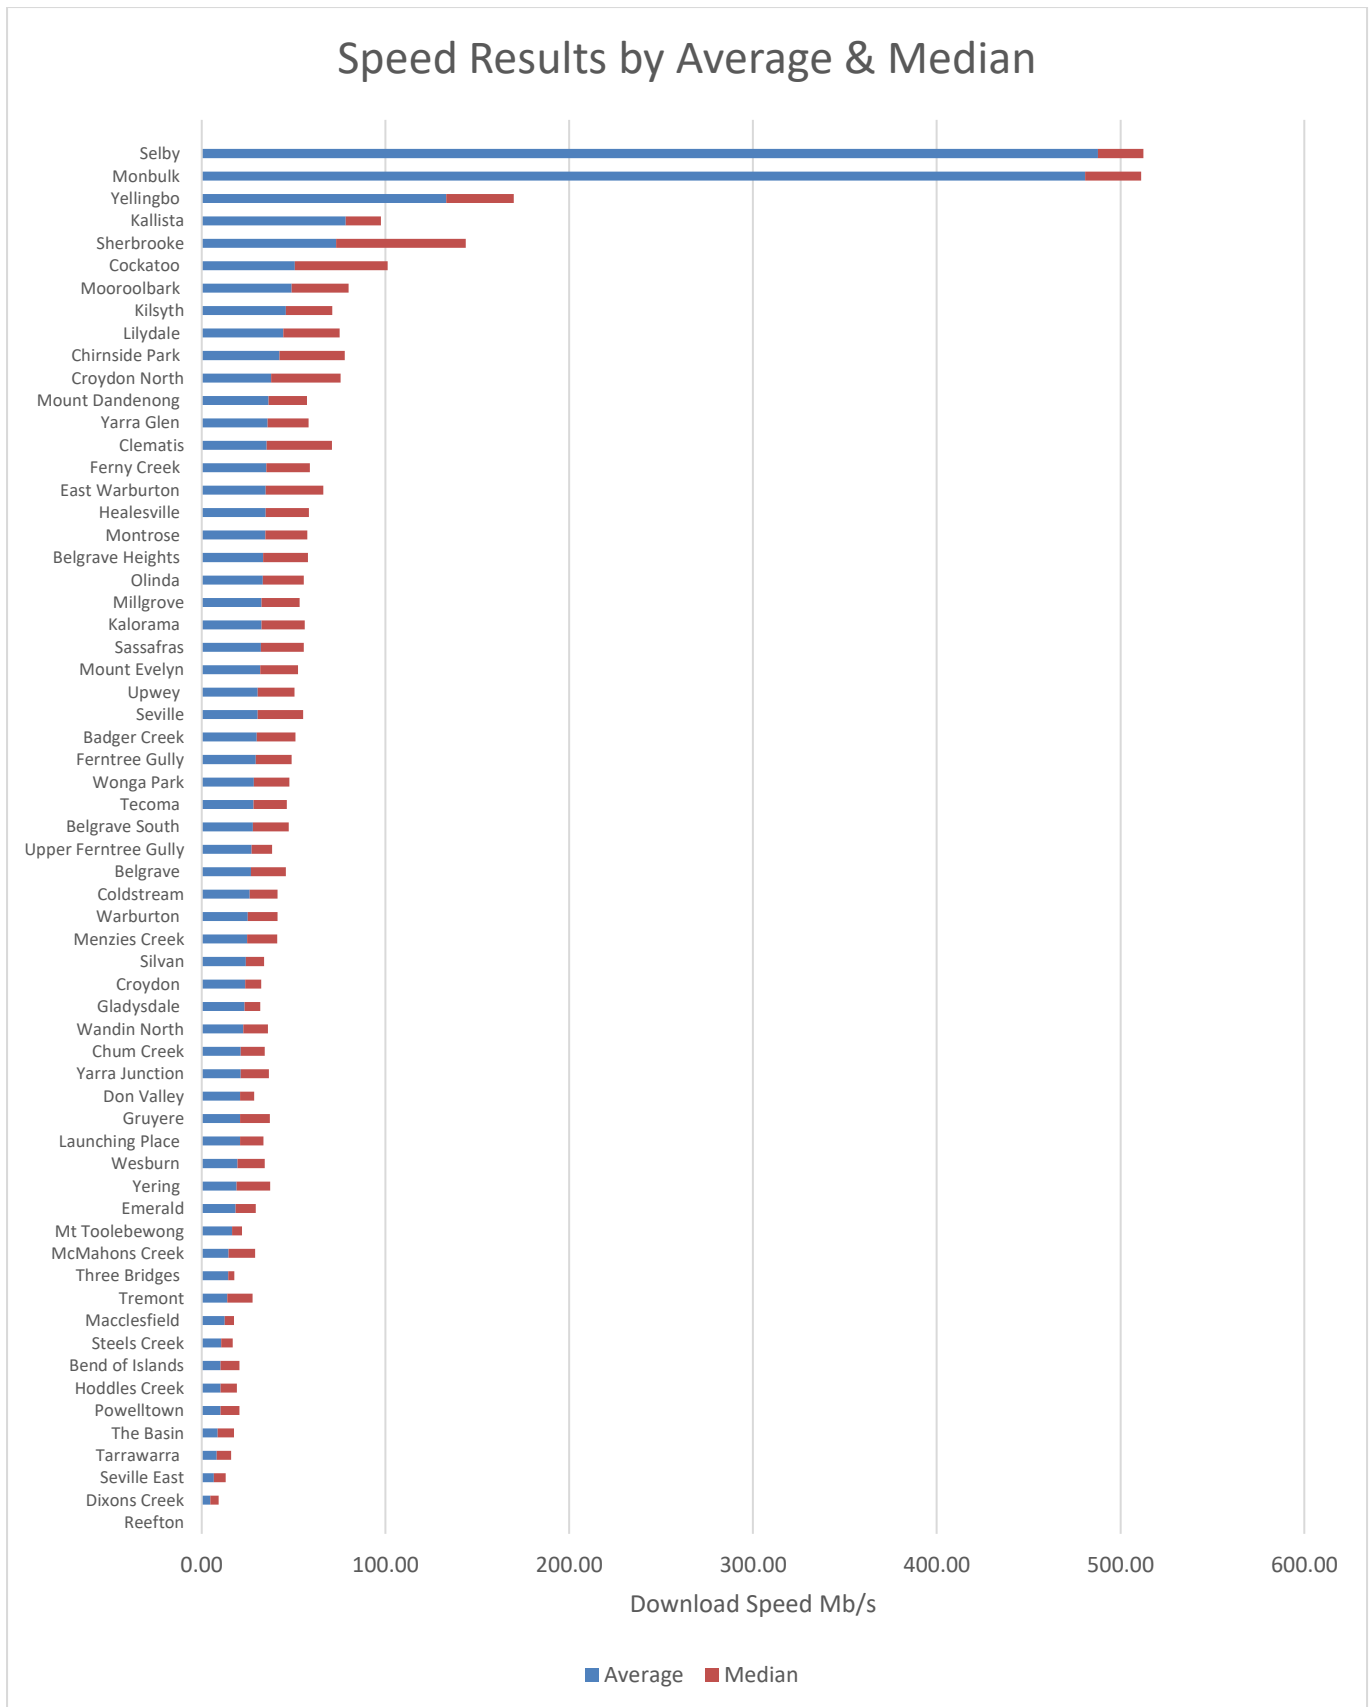

Figure 14 – Fixed internet average and median test speeds

The average and median test speeds for the survey locations are displayed in table below, Table 4 - Fixed internet average and median test speeds. These are sorted by median, rather than average.

Of the 61 Yarra Ranges localities where testing was conducted, only 18 had a median speed less than 12 Mb/s. Of the localities that were connected to fixed NBN services there was zero locations that registered a median below 12 Mb/s, the minimum NBN plan speed. Of those localities that registered a median below 12 Mb/s, over 90% of users were using ADSL copper fixed internet services. Please see Figure 15 – Speed testing map for a graphical representation of the speed testing.

Suburb	Average (Mb/s)	Median (Mb/s)
Sherbrooke	73.17	70.43
Cockatoo	50.59	50.59
Croydon North	37.74	37.74

Dixons Creek	4.68	4.50
Three Bridges	14.38	3.33
Reefton	0.00	0.00

Table 4 - Fixed internet average and median test speeds

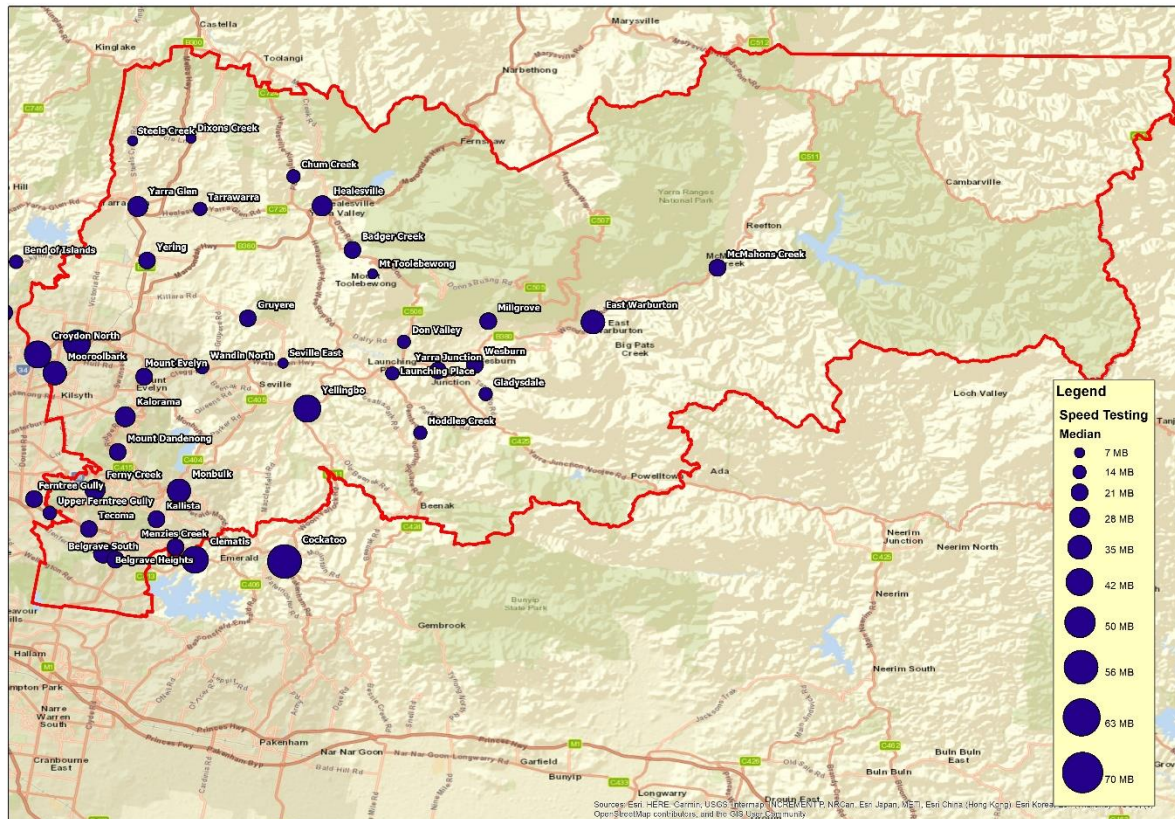

Figure 15 – Speed testing map

9. NBN Availability Survey

As part of the provision of fixed internet services in the Yarra Ranges, it is important to understand the availability of NBN services. Based on network architecture, NBN has rolled out a mixed technology model in Yarra Ranges. The NBN technology for the respective localities (suburbs or townships) are listed below.

Of all localities in the Yarra Ranges, FTTN features as the available technology for 30% of localities, followed by SkyMuster satellite (25%), Fixed Wireless (21%), FTTC (20%), and HFC (4%).

These figures highlight that 46% of the Yarra Ranges localities are serviced by wireless technology, either satellite or fixed wireless. This availability is also linked to the most isolated communities in the Yarra Ranges, highlighting their vulnerability. Both satellite and fixed wireless technologies, in the GHz bands, are affected by smoke and certain climatic conditions.²⁰ GHz band technologies are impacted more significantly from bushfire smoke than technologies lower on the spectrum band, such as mobile phone²¹, broadcast TV and radio and land mobile radio.

The graph below, Figure 16 – NBN technology availability summary Yarra Ranges (locality), displays the spread of NBN technologies in the Yarra Ranges.

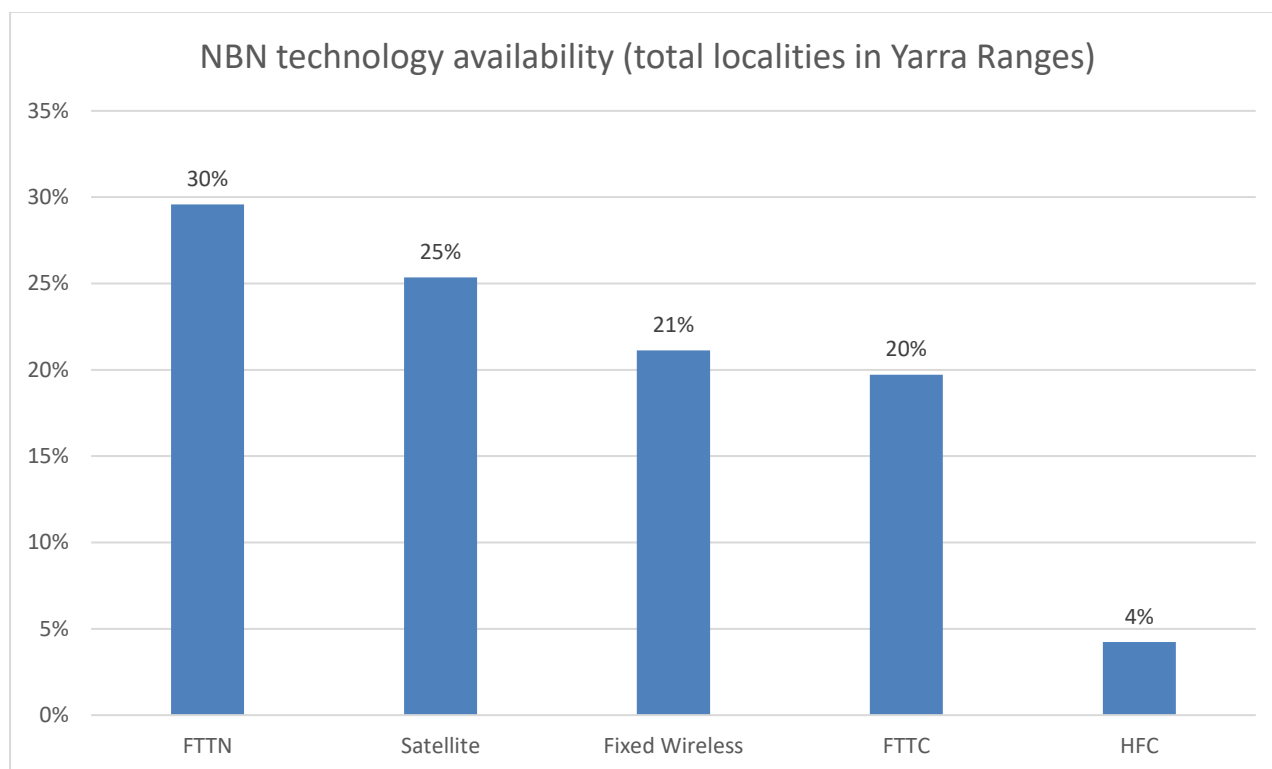

Figure 16 – NBN technology availability summary Yarra Ranges (locality)

²⁰ Radio Propagation in Fire Environments - Adelaide University Research, Johnathon Boan 2009

²¹ See Table 2 - Mobile Telecommunications Carriers and networks

The following maps display the coverage areas for the respective NBN technologies.

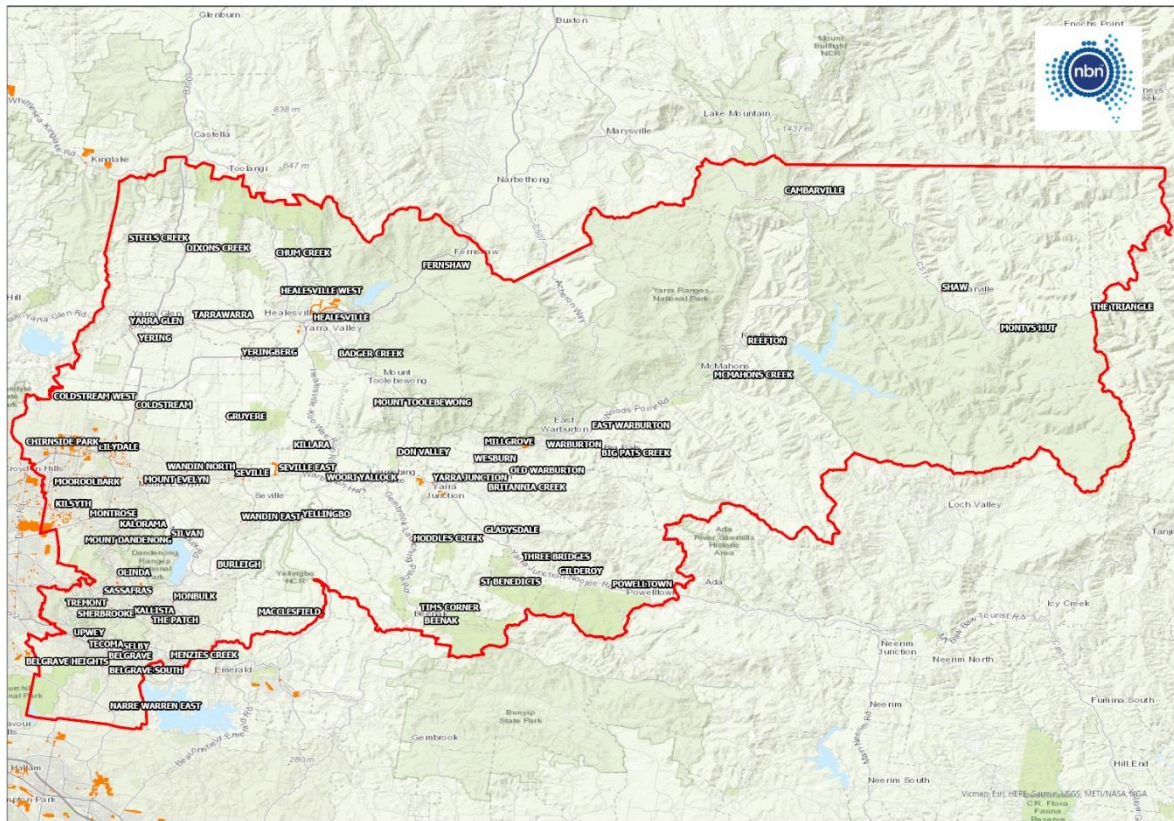

Figure 17 – NBN FTTP coverage area (orange)

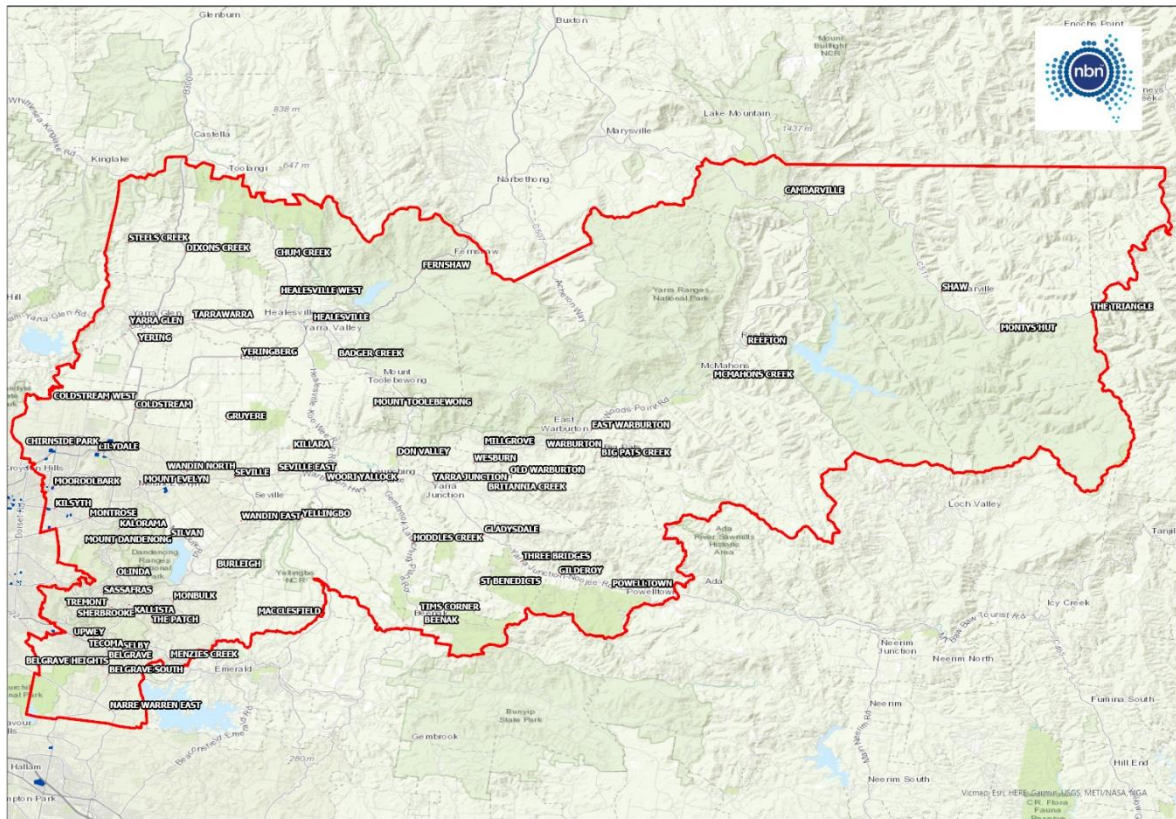

Figure 18 – NBN FTTB coverage area (blue)

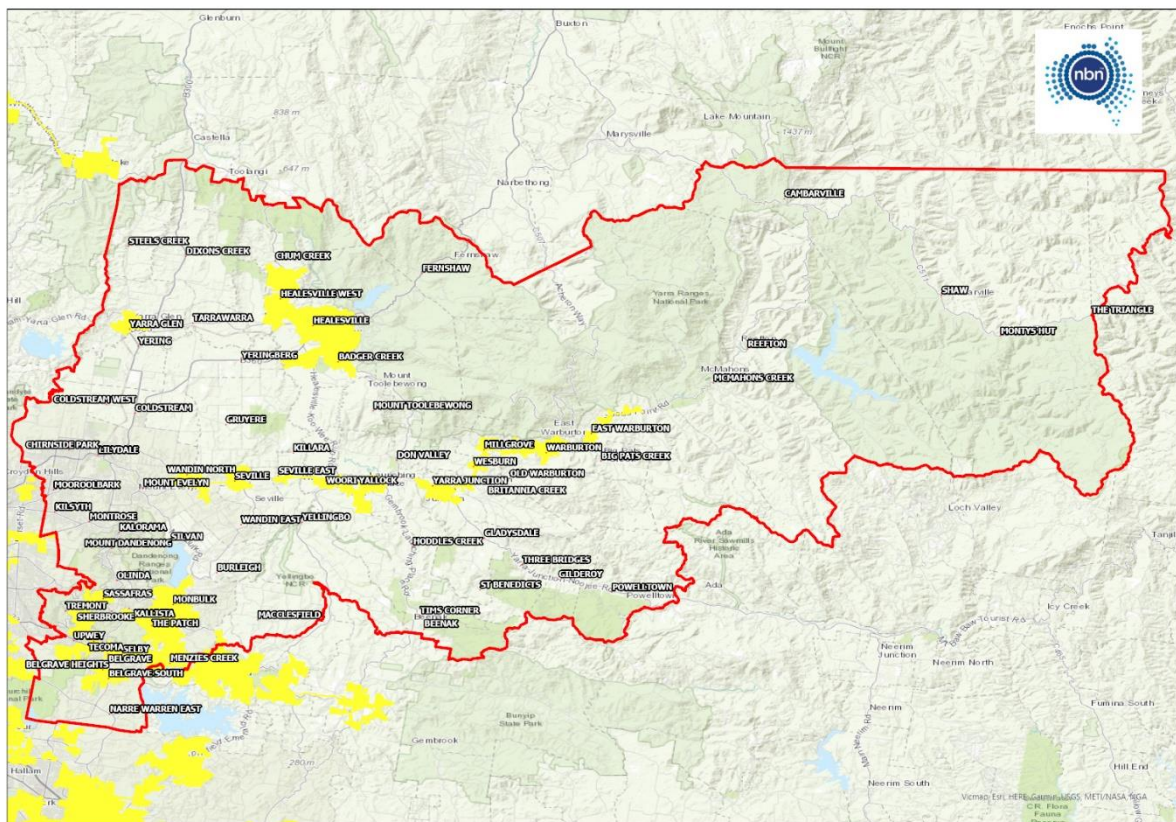

Figure 19 – NBN FTTN coverage area (yellow)

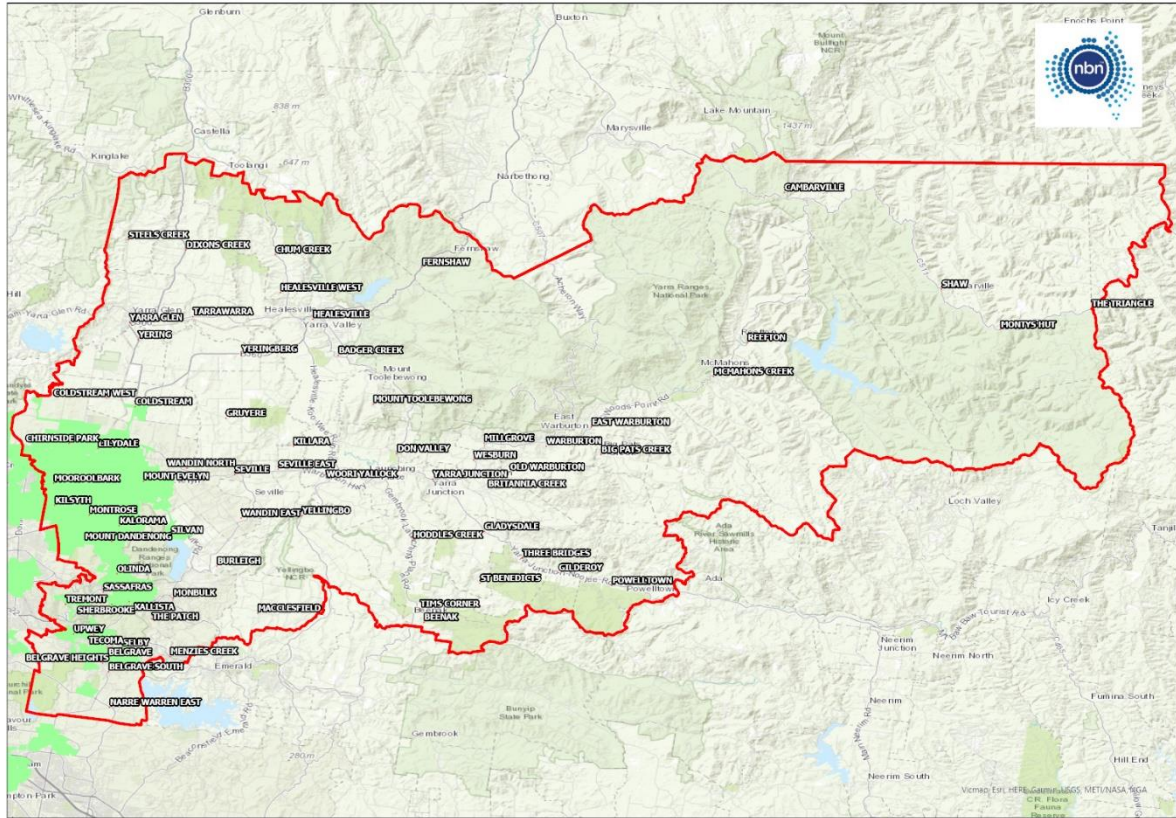

Figure 20 – NBN FTTC coverage area (light green)

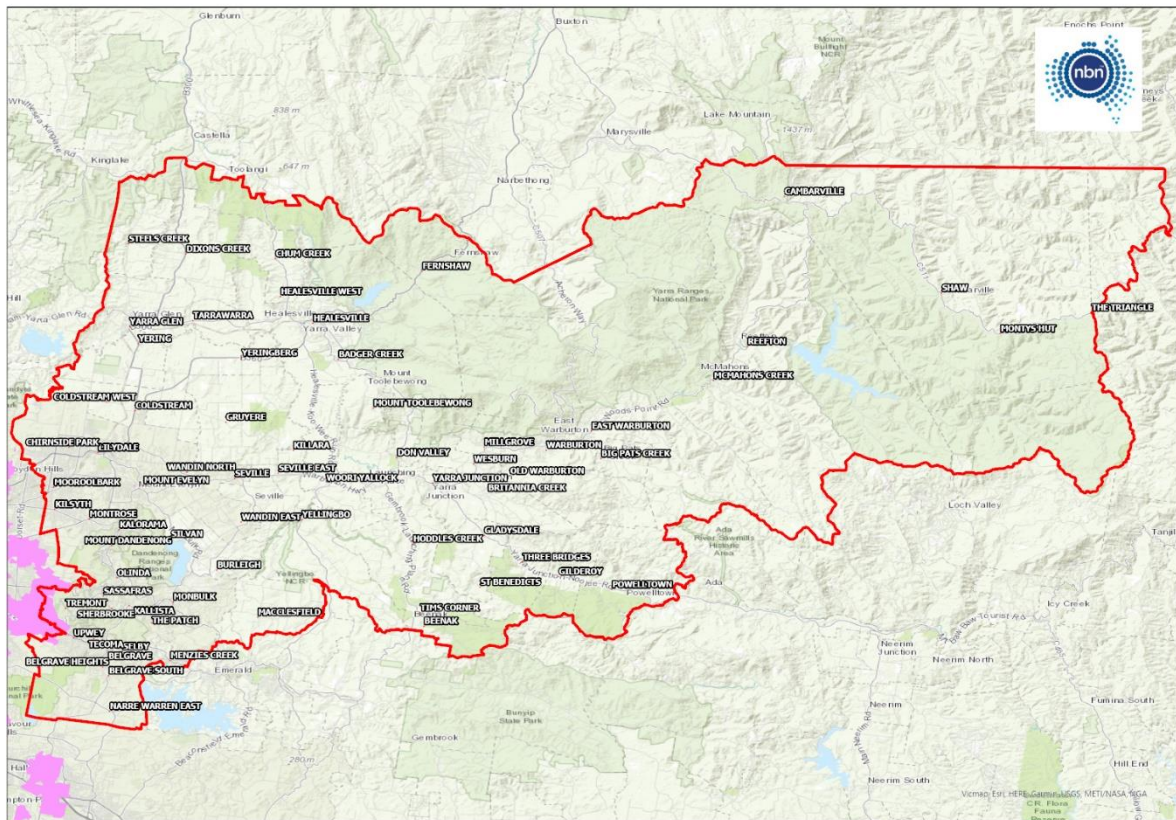

Figure 21 – NBN HFC coverage area (purple)

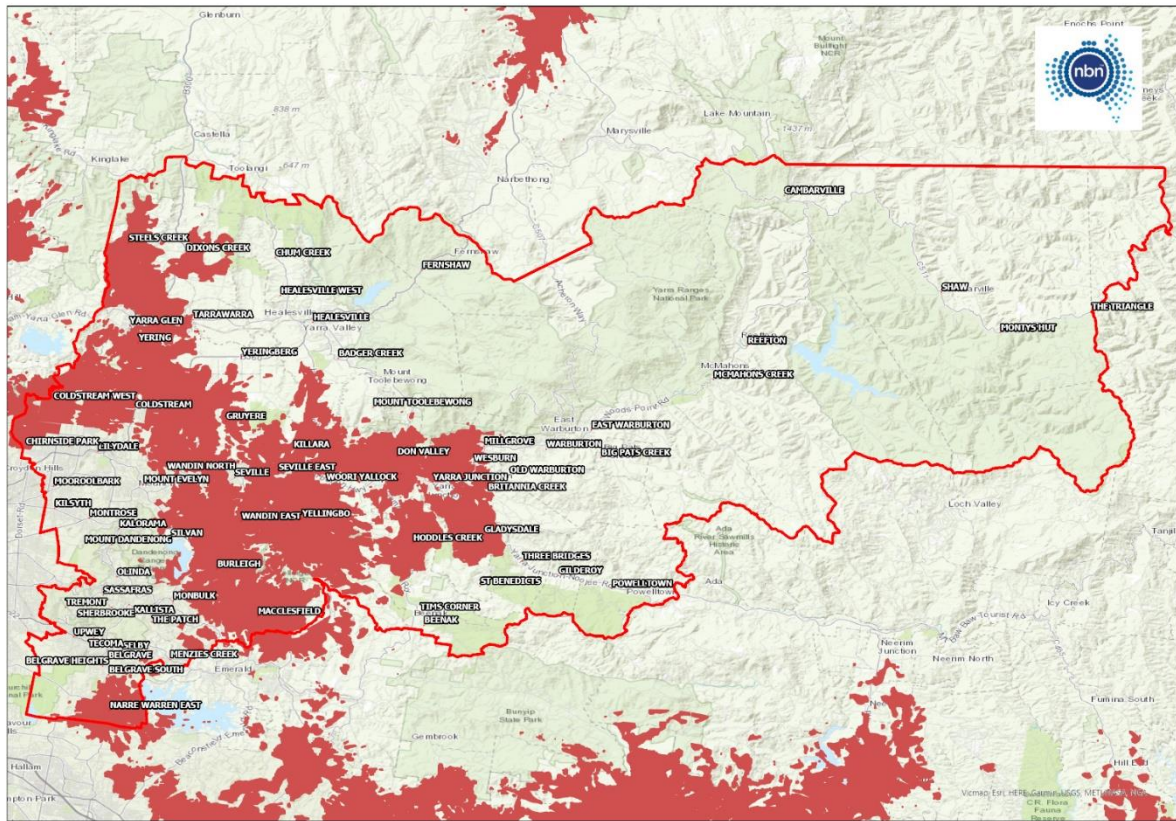

Figure 22 – NBN Fixed Wireless coverage area (red)

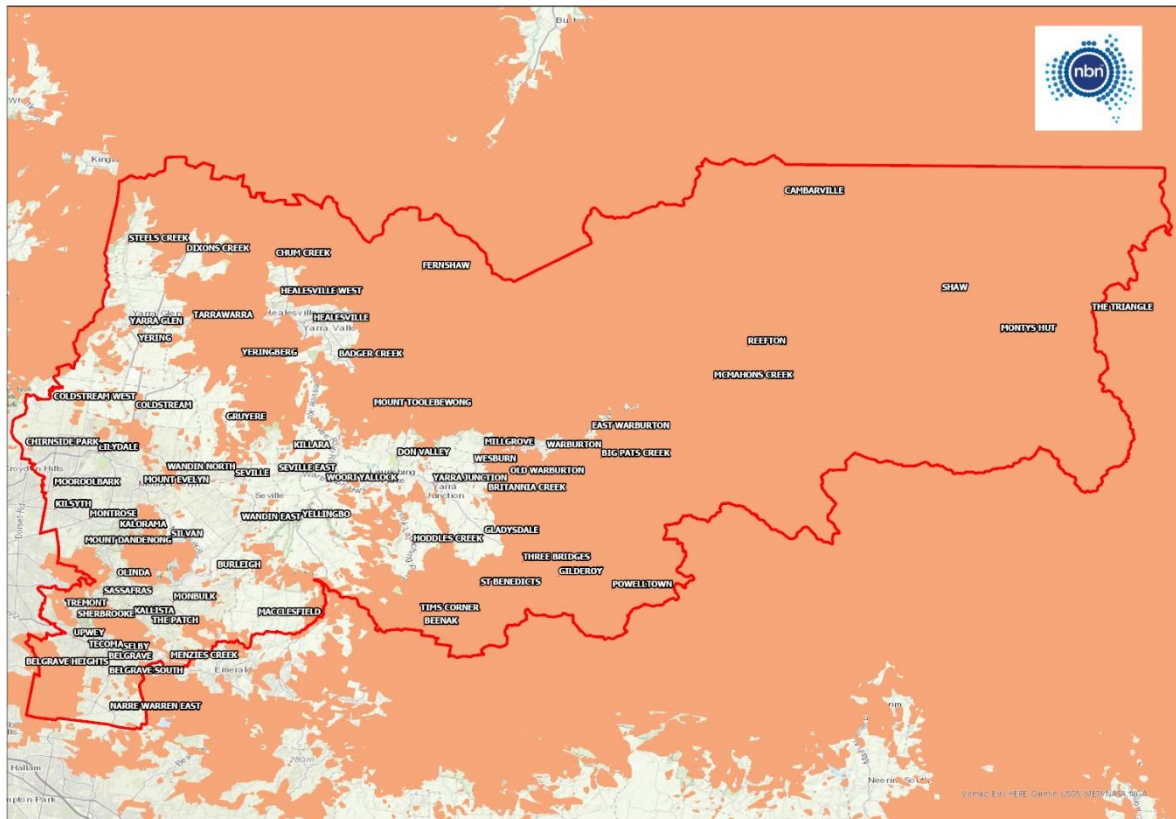

Figure 23 – NBN Satellite (SkyMuster) coverage area (light orange)

The table below, Table 5 - NBN technology availability by locality, displays the availability of NBN technologies in the Yarra Ranges by locality (suburb or township). This table highlights the disparity in fibre-cable-based services availability for the remote and isolated communities. Fibre-cable-based technologies are largely available in the urban and hills areas, and wireless (satellite & fixed wireless) are available across the valley and regional townships. Fixed wireless services typically deliver 40% slower download speeds than fixed line services (based on highest speed plans).²²

10. Mobile Telecommunications Carrier Testing

8.1 Baseline Assessment

The baseline assessment criteria for testing locations involves four components. They are:

- Yarra Ranges priorities and study area
- Review of carrier advertised coverage
- Mobile black spot program data
- Local information assessment

10.2 Yarra Ranges Priorities & Study Area

The testing of mobile coverage is part of a wider program of initiatives aimed to address the Yarra Ranges priority to provide an equitable communication network for all residents and businesses. The secondary initiative is aimed at ensuring that communication coverage is resilient to meet emergency management requirements.

The road transport infrastructure network provides the backbone of the municipality and basis for tourism, transport, safety, and wellbeing of the communities it serves. Alongside the long-term development of these road networks, mobile communications are becoming increasingly critical to the effective functioning of regional and remote communities. The Yarra Ranges priority routes that were tested as part of this project are listed below and mapped in Figure 30 – Completed drive testing routes.

- Maroondah Hwy (34)
- Victoria Road
- Melba Hwy (B300)
- Healesville-Yarra Glen Road (C726)
- Steels Creek Road
- Healesville-King Lake Road (C724)
- Myers Creek Road
- Marysville-Wood Point Road (C512)
- Warburton-Woods Point Road (C511)
- Warburton Hwy (B380)
- Big Pats Creek Road
- Old Warburton Hwy
- Donna Buang Road (C507)
- Donna Buang Road (C505)
- Yarra Junction-Noojee Road (C425)
- Gembrook-Launching Place Road (C424)
- Healesville-Koo Wee Rup Road (C411)
- Clegg Road (C402)
- Emerald-Monbulk Road (C406)
- Monbulk Road (C404)
- Olinda Creek Road

- Belgrave-Hallam Road (C404)
- Belgrave-Gembrook Road (C412)
- Burwood Hwy (C412)
- Mount Dandenong Tourist Road (C415)

In addition to the road transport infrastructure network, the following points of interest (POI) were also tested and mapped in Figure 31 – Yarra Ranges POI's.

- Regional and Rural Localities
- Community Fire Refuges
- Neighbourhood Safer Places (Places of Last Resort)
- ESTA Emergency Markers (where the marker was on a roadside location)
- Council Fire Fighting Water Tanks
- Educational Facilities (excluded urbanised locations)²³
- Community Centres (excluded urbanised locations)¹⁶
- Aged Care and Centre Citizens Centres (excluded urbanised locations)¹⁶
- Country Fire Authority Stations
- Regional and Rural Bus Stops

In total there were 655 identified POI's within the Yarra Ranges. These POI's were added to the drive testing and brief stops were made at these locations. Where there were multiple POI's in a similar location, only one test was undertaken at the most central location, for example Yarra Glen CFA station, Yarra Glen Memorial Hall, Council Hub and Yarra Glen Pre-School.

10.3 Mobile Telecommunications Carrier Coverage Maps

Each of the three Australian mobile network operators provide information about their coverage on their respective websites.

Within Yarra Ranges, Telstra has the most extensive coverage, followed by Optus, and Vodafone is third with coverage only in central part of the municipality. Refer the following maps for specific coverage.

Telstra has the most comprehensive 4G coverage in the Yarra Ranges. This was supplemented by small patches of 3G coverage, mainly in the eastern areas of the Yarra Ranges. It must be noted that Telstra's 3G footprint is shrinking as it begins to decommission the network, to permit spectrum reframing for 5G technology.

²³ Urbanised locations were excluded, however if the location / facilities were transited past on route to other locations it was included in the survey results.

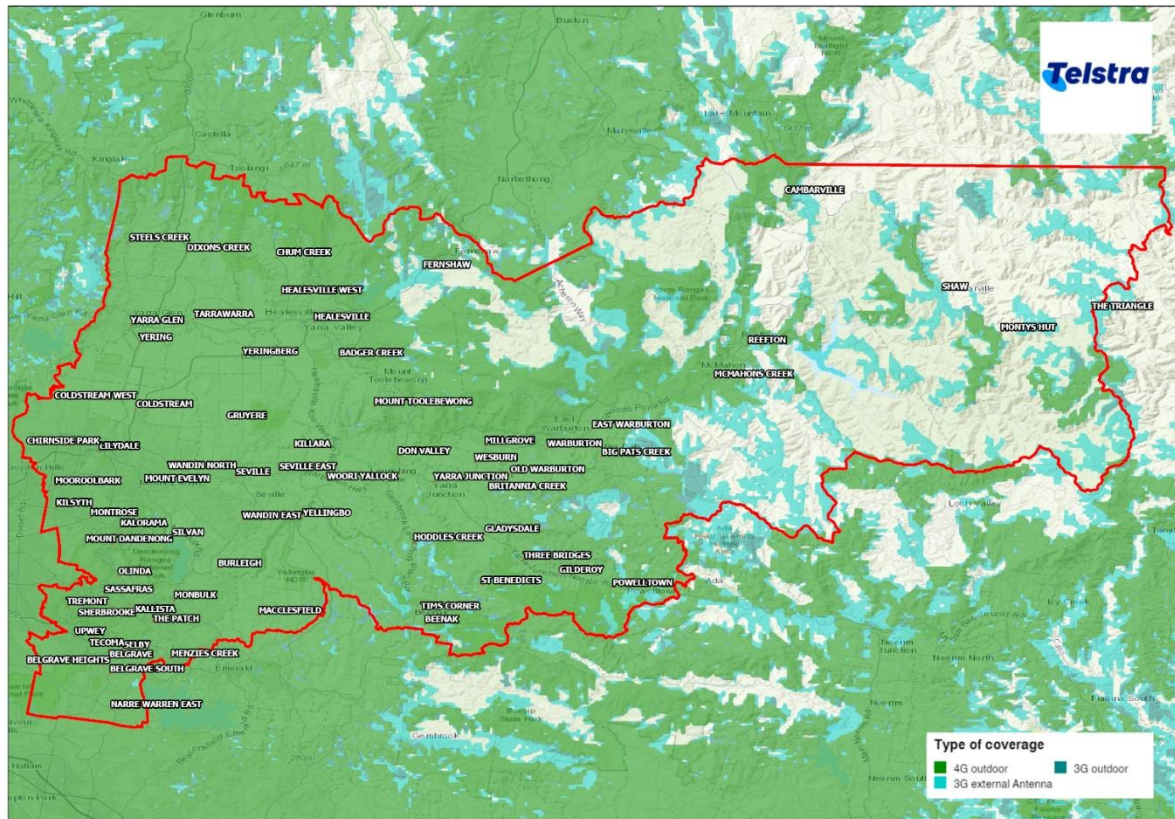

Figure 24 – Telstra 3G & 4G Coverage Map

Telstra was the only carrier with notable 5G coverage in the Yarra Ranges. The was mainly limited to the metropolitan fringe of the Yarra Ranges, Healesville, and the Warburton Valley.

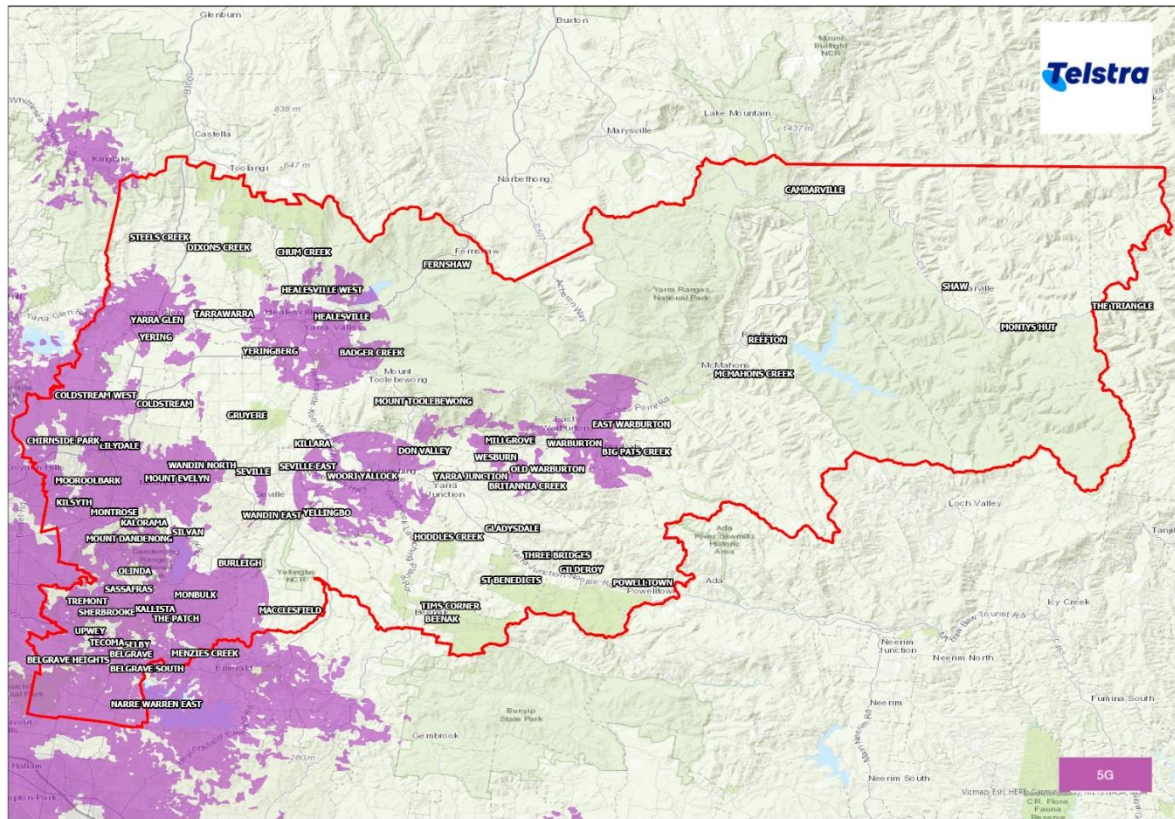

Figure 25 – Telstra 5G Coverage Map

Optus has the next most comprehensive 4G coverage in the Yarra Ranges, which is closely aligned to the Telstra coverage. This was supplemented by small patches of 3G coverage. It must be noted that Optus' 3G footprint is shrinking as it begins to decommission the network, to permit spectrum reframing for 5G technology. The current Optus 5G coverage in Yarra Ranges is insignificant.

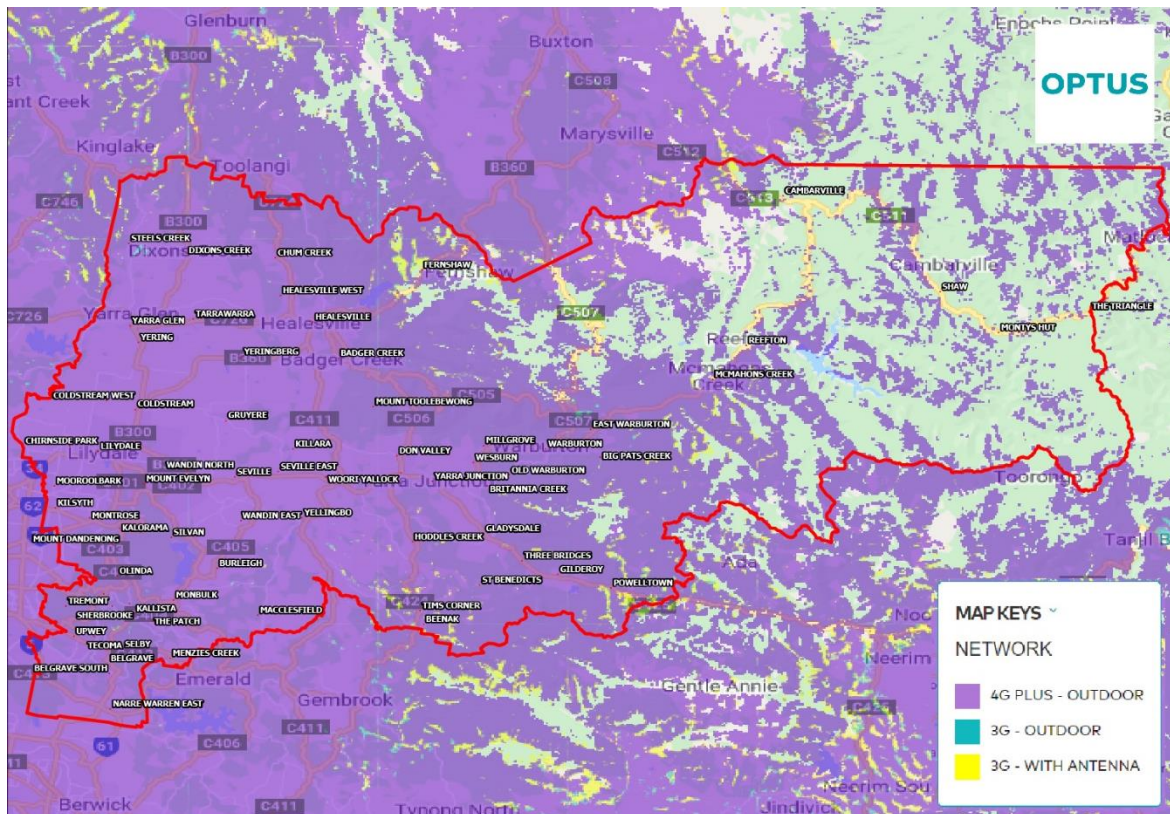

Figure 26 – Optus 3G & 4G Coverage Map

Vodafone’s coverage was significantly less than Telstra and Optus. Vodafone’s 4G coverage in the Yarra Ranges, is mainly limited to the western section of the Yarra Ranges. This was supplemented by small patches of 3G coverage. It must be noted that Vodafone’s 3G footprint is shrinking as it begins to decommission the network, to permit spectrum reframing for 5G technology. Vodafone has no 5G coverage.

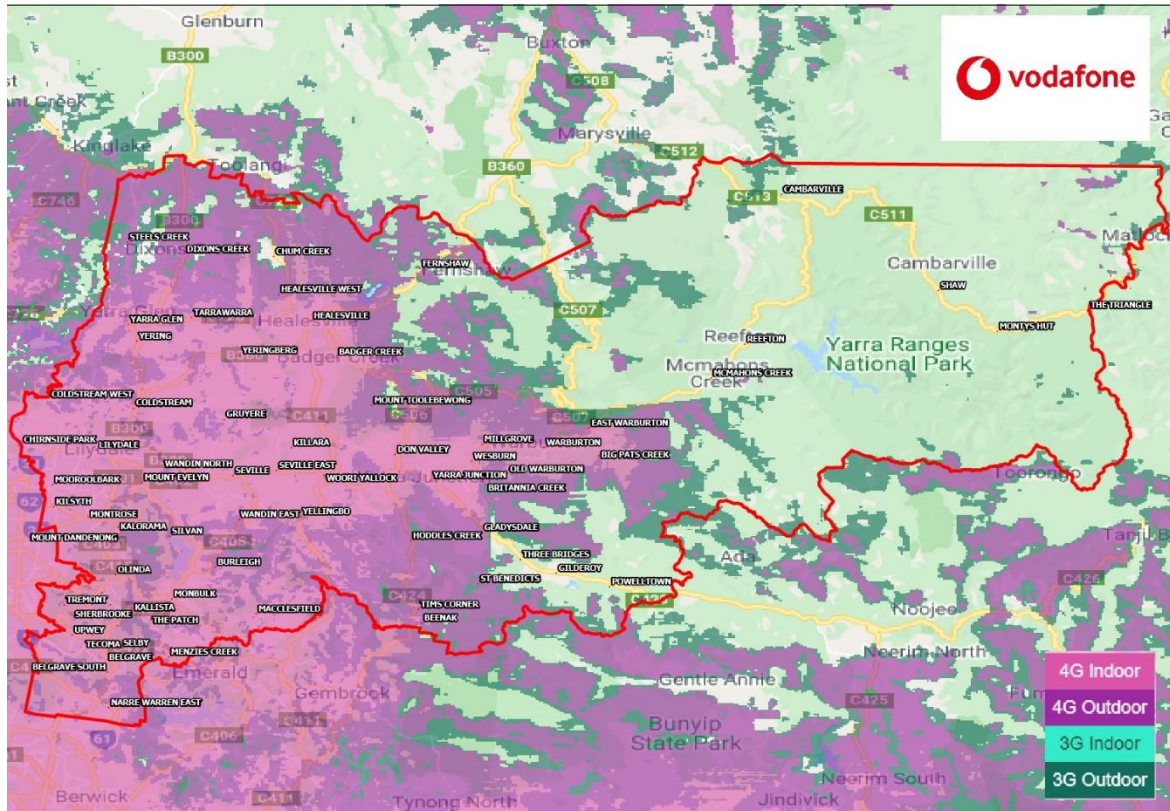

Figure 27 – Vodafone 3G & 4G Coverage Map

11. Mobile Black Spot Program

The Mobile Black Spot Program (MBSP) was announced by the Commonwealth Government in 2015. Since 2015, there have been six rounds of funding completed. This included round 5A, which was an individual round. All rounds up to and including round 5 have been rolled out and round 5A funded base stations will commence shortly²⁴.

Rounds 1 and 2 of the MBSP led to a disproportion funding model to favour some areas with comparatively higher levels of existing coverage. These areas achieved funding reflective of providing an even spread of spending nationally on an eligible electorate basis. Backing by local political representatives based on Commonwealth electorates was identified as a success factor. Commonwealth electorates are based on population, which may have impacted Yarra Ranges disproportionately in the early rounds.

There was a program shift from round 4 onwards to focus on funding sites to promote regional and remote locations, including Public Interest Premises, across Australia. These criteria did not have linkages to resilience of mobile telecommunications infrastructure, however, and were purely based on coverage. The program did not fund black spots on the need for 'site hardening' alone. This has left regional and remote areas vulnerable to network outages due to severe events, such as storm and bushfire.

An update by the Department of Transport, Infrastructure, Regional Development and Communications on 30 April 2021 stated that 923 base stations have already been activated as part of the program to date, delivering improved coverage outcomes and benefits to the Australian community.²⁵

Mobile Black Spot Program Registration Database

For the initial MBSP rounds, the Department of Communications invited crowd sourcing of mobile phone black spots. Residents, business, industry, and government could contribute to map black spot areas across Australia (see Figure 28 - National Map- Mobile Black Spot Database for Yarra Ranges). Following the initial consultation, there were 6,221 black spots submitted to the national database. This database increased to 10,802 during round 2 program, mainly due to the extra publicity the program received after the initial consultation²⁶. Although the national database has provided an insight for the selection of locations to be funded, mobile network operators are now, from round 3 onward, requested to nominate where they would build new or upgraded base stations.

The issue of using crowd sourcing to identify mobile phone black spots is the subjective way nominees identified coverage issues. Nominations did not link to proven coverage testing benchmarks. Furthermore, the national database was not qualified in any way. For example, nominees with an Optus coverage issue could nominate a blackspot even if a competitive carrier had coverage at that location.

²⁴ <https://www.communications.gov.au/what-we-do/phone/mobile-services-and-coverage/mobile-black-spot-program/frequently-asked-questions-mobile-black-spot-program>

The following map, - National Map- Mobile Black Spot Database for Yarra Ranges, is sourced: <http://nationalmap.gov.au> with Mobile Black Spot Database selected Date 30 April 2021. The blue dots are the reported black spots in Yarra Ranges, with the red squares being the awarded base stations (see section below).

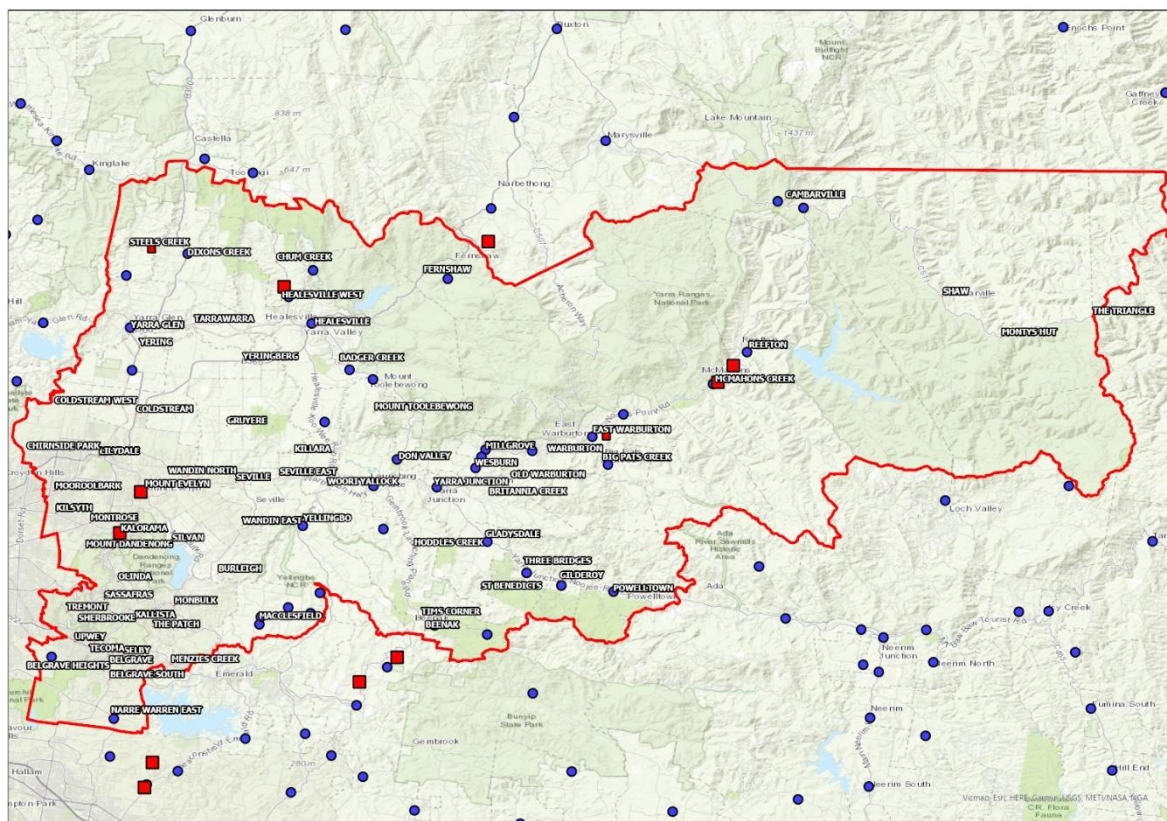

Figure 28 - National Map- Mobile Black Spot Database for Yarra Ranges

Mobile Black Spot Program results for Yarra Ranges

Yarra Ranges has benefited from the first five rounds of the MBSP. A total of 8 sites have been approved and funded (Refer Figure 28 - National Map- Mobile Black Spot Database for Yarra Ranges). The majority have been approved for Telstra with 1 site for Optus and 1 site for Vodafone (Refer Table below).

Location	MBSP identifier	Applicant	Cell Type	Round
Dixons Creek	MBSP-VIC-033	Telstra	Macrocell	1
East Warburton	MBSP-VIC-036	Telstra	Macrocell	1
McMahons Creek	MBSP2-VIC-018	Telstra	Macrocell	2
Reefton	MBSP2-VIC-024	Telstra	Macrocell	2
Chum Creek	MBSP4-VIC-010	Optus	Macrocell	4
Chum Creek	MBSPPL-VIC-06	Telstra	Macrocell	2
Kalorama	MBSPPL-VIC-11	Vodafone	Macrocell	2
Mount Evelyn	MBSPPL-VIC-13	Telstra	Macrocell	2

Table 6 – Awarded Yarra Ranges

12. Cellular Testing Results

As an independent testing organisation, CartGIS provides impartial user experience-based reports and recommendations. The methodology used by CartGIS to independently test mobile network performance and identify carrier blackspots has been developed and refined over the last 10 years.

We used three Samsung A12 handsets, as commonly used by members of the public, to capture information about the signal strength and network performance for each for the three national carriers - Telstra, Optus & Vodafone. This benchmarking process provides a robust methodology acknowledged and respected by the carriers.

Clients typically use the report and specific recommendations to advocate for increased funding by Federal and State governments together with each of the three national carriers – often through the Mobile Black Spot Program.

We tested with an app we have developed specifically for this purpose – DriveCell Network Test to capture all the information we can about the mobile network and the test device itself. An example of the DriveCell app screen can be seen in Figure 29 – DriveCell App.

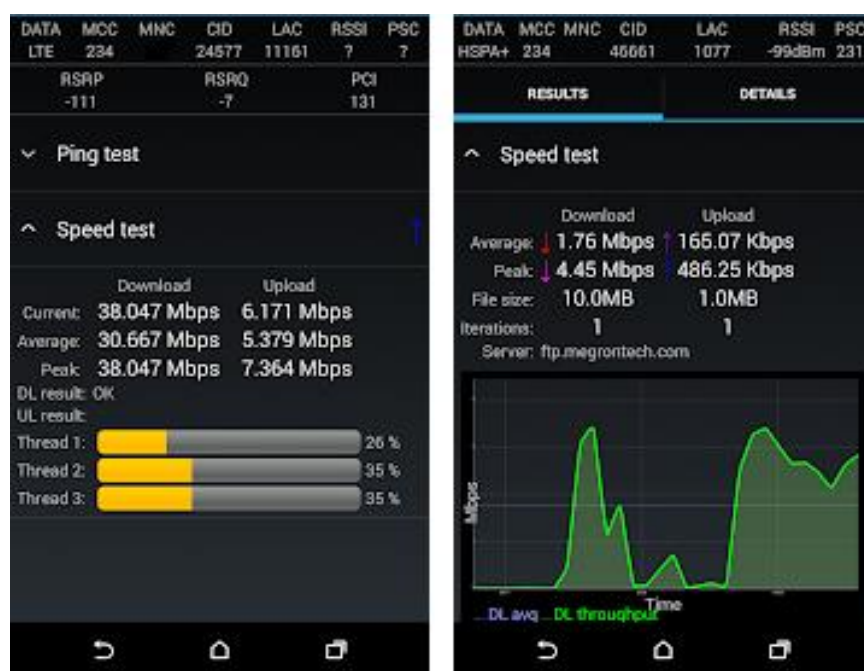

Figure 29 – DriveCell App

By providing the GPS location and current results in real time, testers can monitor and authenticate the testing accuracy in real time. Our testing is now completed using Android handsets with the results available in near real-time from an online portal.

We installed three mobile phones (one for each carrier) across the front of the test vehicle. We complied with driver sight line requirements and achieved required separation distances to avoid radio interference.

There are five simple principles used to inform our testing methodology:

- User experience based – we use handsets commonly owned by users rather than other more technical and theoretical approaches.
- Same handset, same settings – this provides an equitable basis for benchmarking network performance.
- Simultaneous testing – all tests are carried out in the same vehicle – spaced to remove interference and completed at the same time in that location.
- Signal Strength – for 3G and/or 4G. Signal strength is based on the Received Signal Strength Indicator (RSSI). RSSI is a measurement of the Radio Frequency / Radio Wave power present in a received radio signal at the mobile phone. This measure is the best indicator of mobile coverage as it considers frequency band, power of the transmitter, quality of the mobile phone receiver and vegetational and graphic obstructions. It does not, however, measure the capacity or the performance of the network.
- Network Performance Test – quality of signal. This measure considers network capacity, speed, and coverage. It uses multiple industry standards performance and quality indicators.

12.1 Testing Routes and Locations

The test program was developed to deliver test results for all routes identified by Yarra Ranges. The total testing distance was 2,252 km and took 70.375 hours to complete. The average speed for testing was 32.05 km/hour. This timeline also included stopping at points of interest.

The map below, Figure 30 – Completed drive testing routes, identifies the routes travelled and tests undertaken. Figure 31 – Yarra Ranges POI's below, identifies the POI locations for testing.

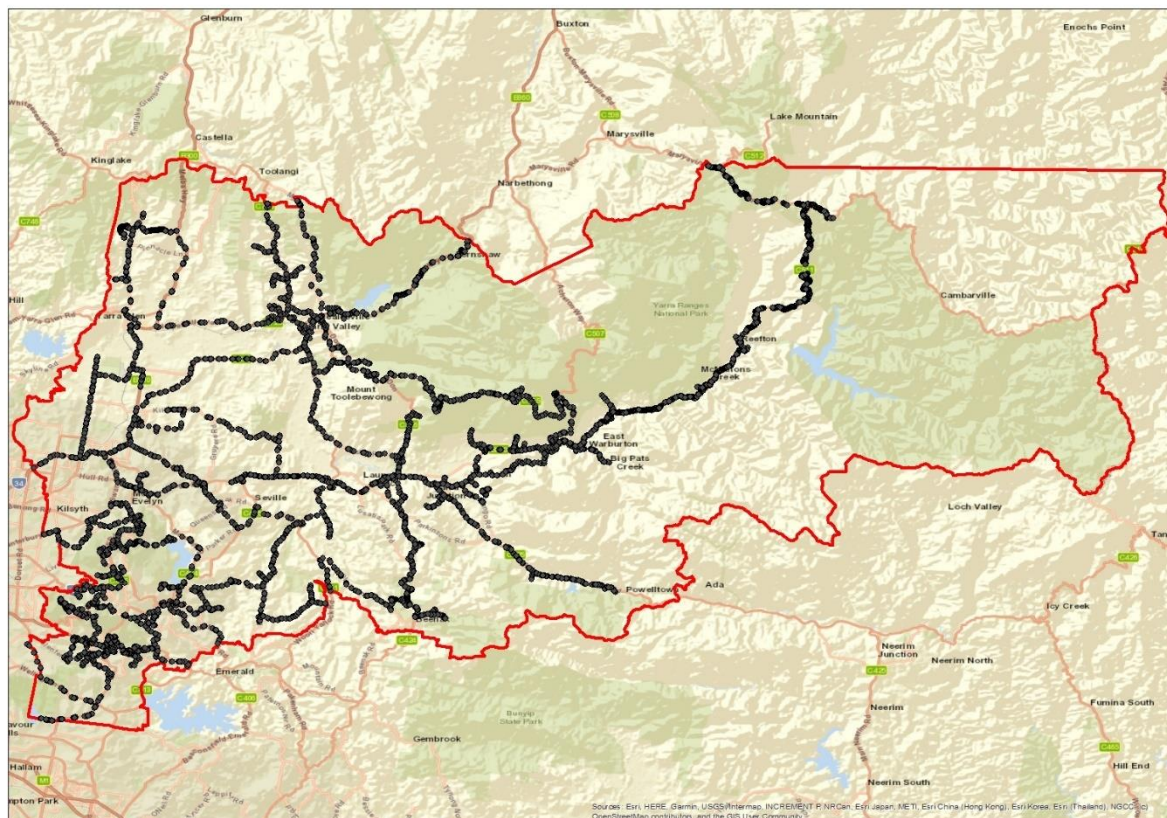

Figure 30 – Completed drive testing routes

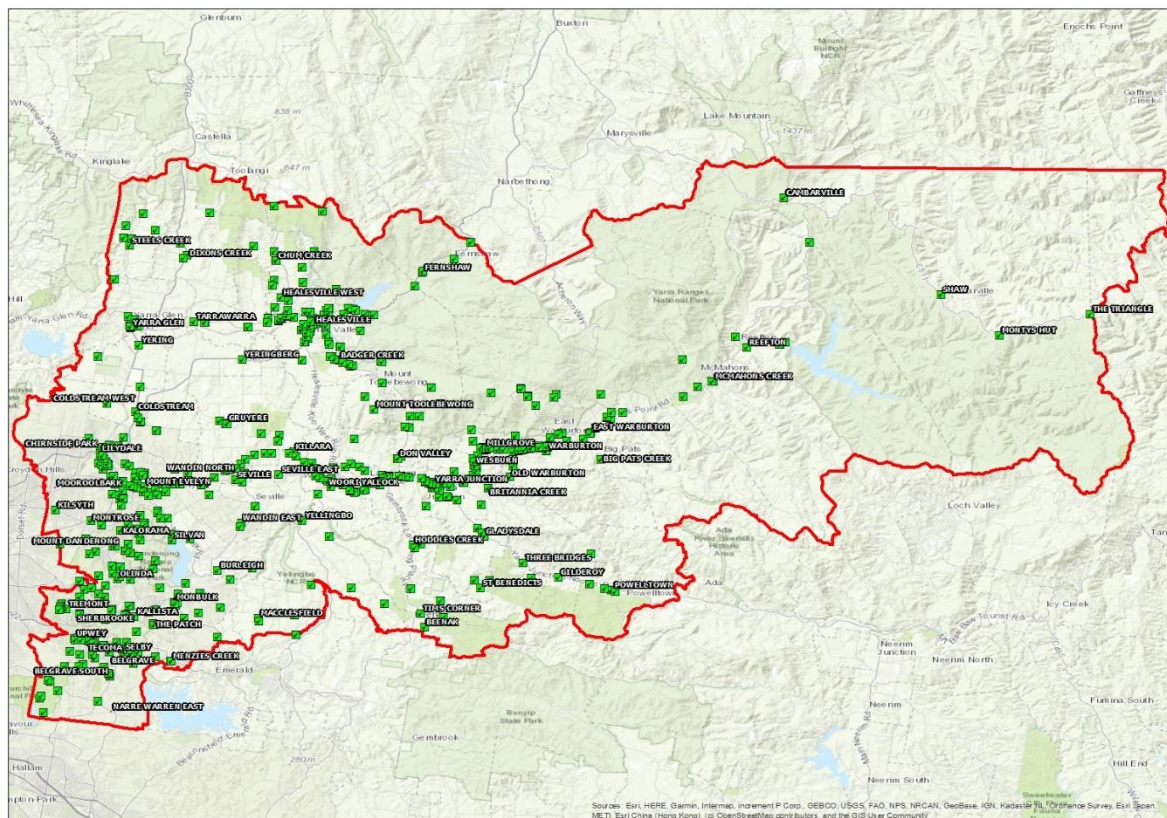

Figure 31 – Yarra Ranges POI's

Due to restrictions such as road works, closed roads, dangerous road conditions, some POI's could not be accessed. POI's that were not located on a road network (such as walking tracks) were not tested due to limited accessibility.

In total there were 24,493 individual mobile coverage tests undertaken across the three carriers.

12.2 Signal Strength

We have tested mobile signal strength for each of the three mobile network operators (Telstra, Optus and Vodafone) in 4G and 3G modes at approx. every 60 seconds for the 2,252 km across the designated routes. This has generated 24,493 marker points in aggregate. This methodology will comprehensively demonstrate the quality of coverage by carriers in each area tested.

Although Telstra has the greater coverage, Telstra is outperformed in some hot spots by either Optus or Vodafone. Overall, though, Telstra maintains its consistently high presence and coverage across network types.

Signal strength by itself is not the best indicator of a network performance as it only shows where local access is possible. The signal strength information combined with the network performance testing provides a clear assessment on the user experience of networks in the region of study.

For the purpose of signal strength, the following map, Figure 32 – 3G/4G signal strength map, highlights the 3G/4G signal coverage in Yarra Ranges, based on the drive testing routes and location for all three carriers.

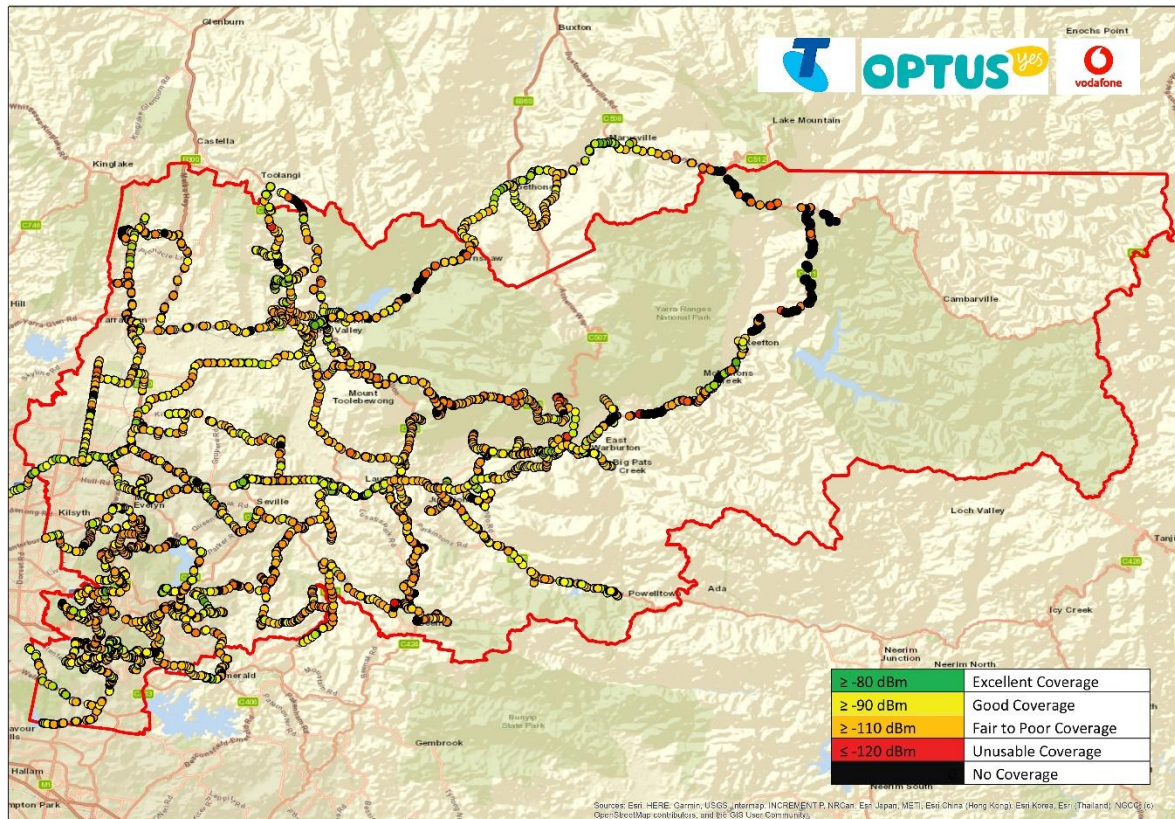

Figure 32 – 3G/4G signal strength map

Black	No coverage
Red	Weak
Orange	Poor
Yellow	Good
Green	Excellent

Across all three carriers there was a high level of variability between advertised coverage and actual signal strength. Carrier coverage maps only show coverage for a particular network with limited qualification of the actual strength. Hence, a projected single bar or less on a phone will be shown as coverage. The user experience, however, is that these are scattered weak signals, distant from the towers and do not translate to reliable consistent network performance.

13. Network Performance Test Results

The Network Performance Test assesses mobile internet connection by combining three measurements of power and quality for 4G networks: RSRP, RSRQ and SINR. The higher the mobile internet connection quality the greater the download speed, upload speed and ping/latency (time taken to reach the internet and back).

Mobile internet connection quality is a true representation of the performance of the network, whereas download speed, upload speed alone does not truly reflect the network performance, capacity, and availability.

The test results will focus predominantly on 4G network performance, as 4G encompasses over 96% of the network tested. Network quality did not measure 3G services.

Network quality is categorised in the following fashion.

	Strong signal enabling maximum data capacity
	Good signal and speeds with no dropouts expected
	Fair/usable signal with possibility of dropouts and slowdowns
	No usable signal - expect frequent disconnections and sluggish performance
	No Coverage

The test results have identified the following locations that are not currently serviced “adequately” by at least one cellular telecommunication carrier with usable network quality.

- a) Residential and business communities not currently serviced “adequately” by at least one cellular telecommunication carrier with usable network quality – target 100%. Locations include:
 - Beenak
 - Hoddles Creek
 - Reefton
 - Steels Creek

- b) Agricultural areas – to ensure smart farming technologies are available. Locations include:
 - Beenak
 - Dixons Creek
 - Gilderoy
 - Gladysdale
 - Hoddles Creek
 - Macclesfield
 - Steels Creek

- c) Tourism locations. Locations include:
 - Acheron Way
 - Cambarville

- Fernshaw
- Gembrook-Launching Place Rd (C424)
- Matlock
- Maroondah Hwy (B360) Healesville to Fernshaw
- Reefton Spur (C511)
- The Triangle
- Upper Yarra Dam
- Warburton-Woods Point Road (C511)
- Woods Point Road (C511) – East Warburton to Cambarville

d) Selected national parks and forestry sites – locations include:

- Big Pats Creek
- Maroondah Reservoir
- Upper Yarra Dam

e) Key sites in times of natural disaster – floods and fires. Locations include:

- Beenak
- Hoddles Creek
- Reefton
- Steels Creek
- Refer to other tourism locations (13.c)

The following map, Figure 33 – Combined Yarra Ranges Network Quality, identifies the Network quality for all carriers in Yarra Ranges and is representative of the locations listed above.

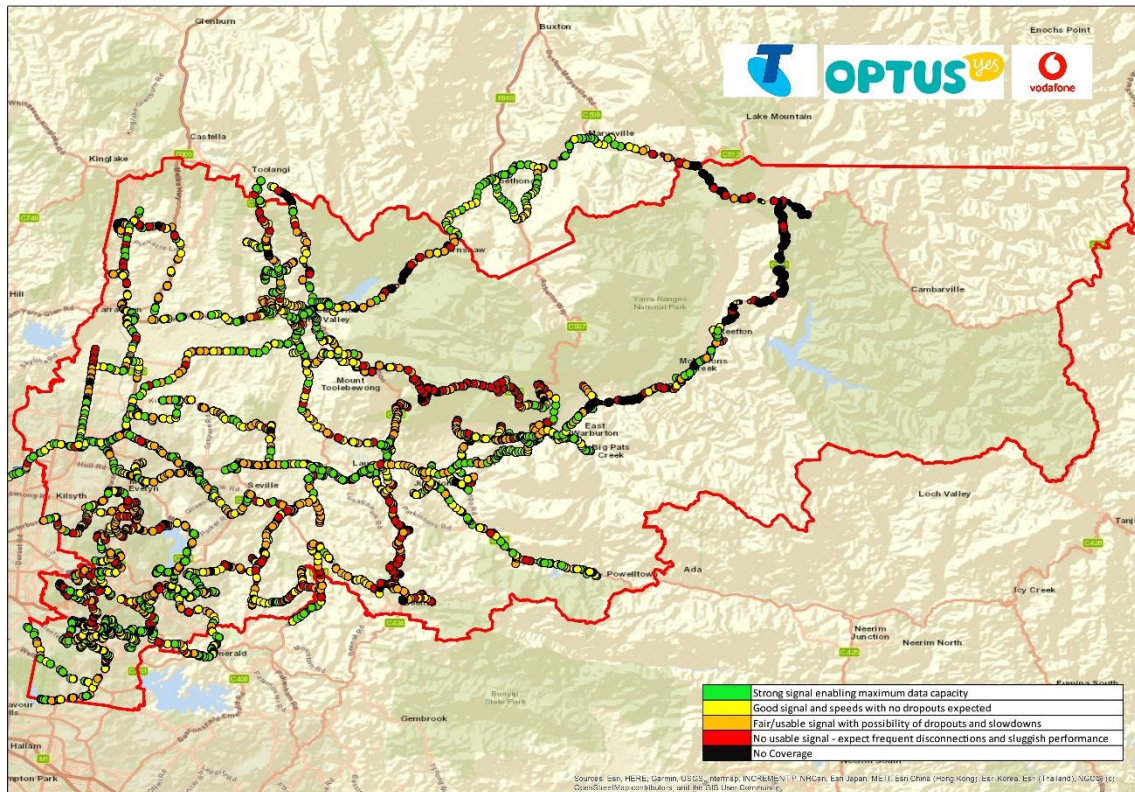

Figure 33 – Combined Yarra Ranges Network Quality

When combined across all carriers, based on drive testing, 27% of the network is strong, 27% good, 21% is fair / usable. However, 25% of the network is unusable signal or no coverage.

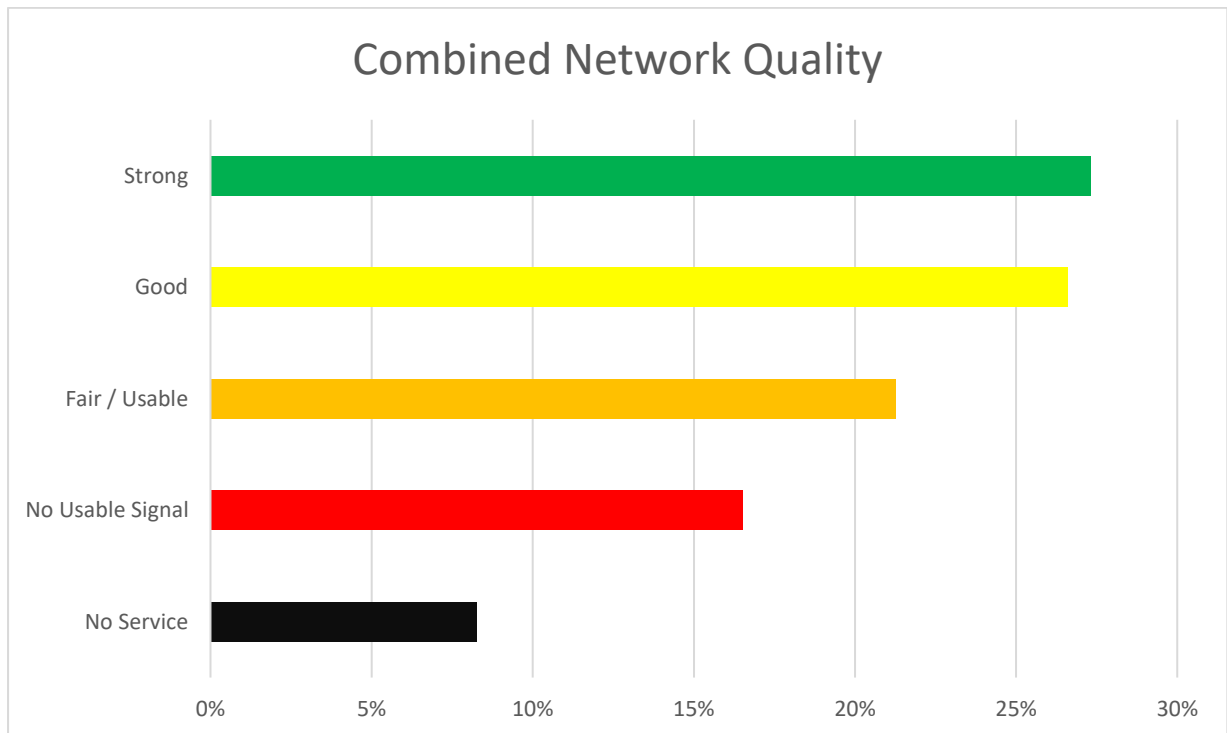

Figure 34 – Combined network quality

When the network quality is broken down into carriers the following results are provided. This is displayed in both Table 7 - Carrier Drive test network quality and Figure 35 – Carrier Drive test network quality.

	Combined	Telstra	Optus	Vodafone
Strong	27%	32%	26%	18%
Good	27%	22%	29%	24%
Fair / Usable	21%	19%	23%	14%
No Usable Signal	17%	17%	15%	16%
No Service	8%	10%	8%	28%

Table 7 - Carrier Drive test network quality

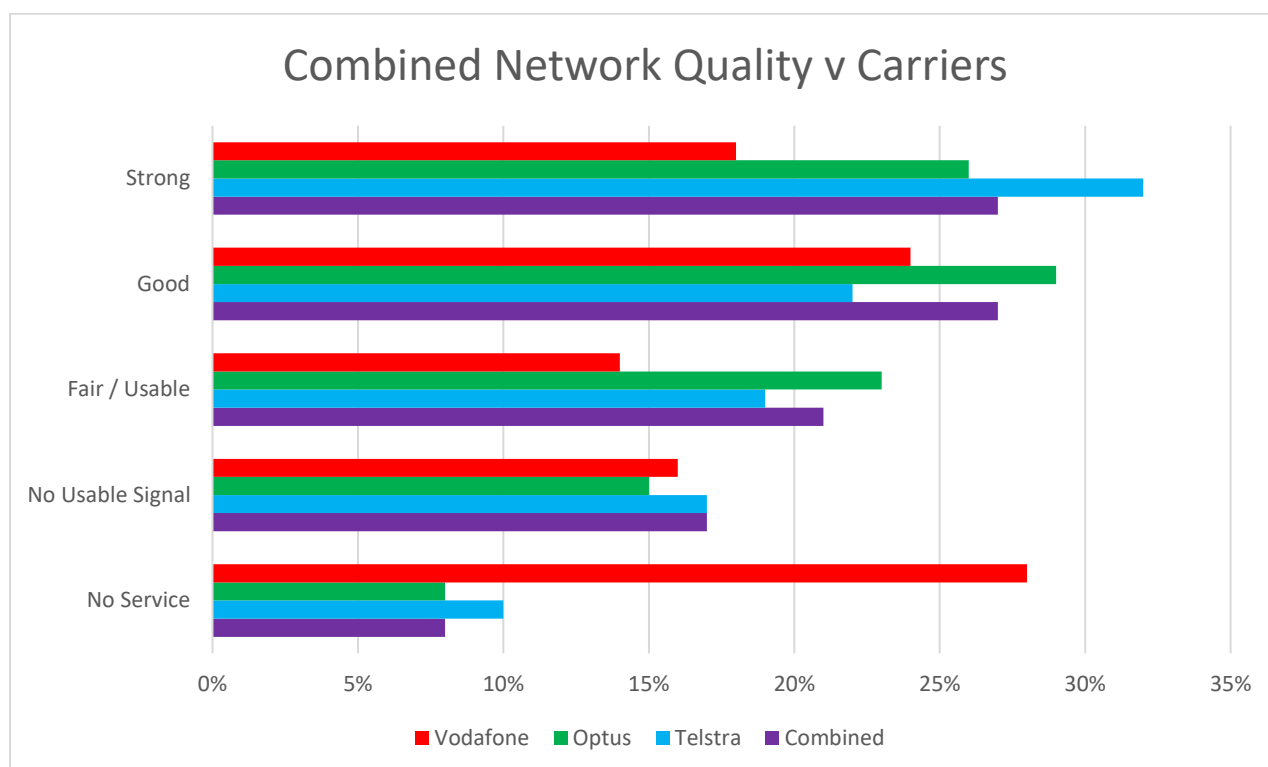

Figure 35 – Carrier Drive test network quality

Based on these results, Optus had the highest usable network quality (strong, good, fair/usable) results at 78% followed by Telstra at 73%. Whereas Vodafone only had 56% usable network quality. This result may be indicative of a higher proportion of Telstra subscribers in the Yarra Ranges, hence reducing capacity and quality from the network.

The following maps (Figure 36, Figure 37 and Figure 38) graphically display the respective carriers network quality. Gaps in the drive testing results data (as indicated on the maps below) are representative of test timeouts. These timeouts are representative of inadequate coverage and capacity to complete a test.

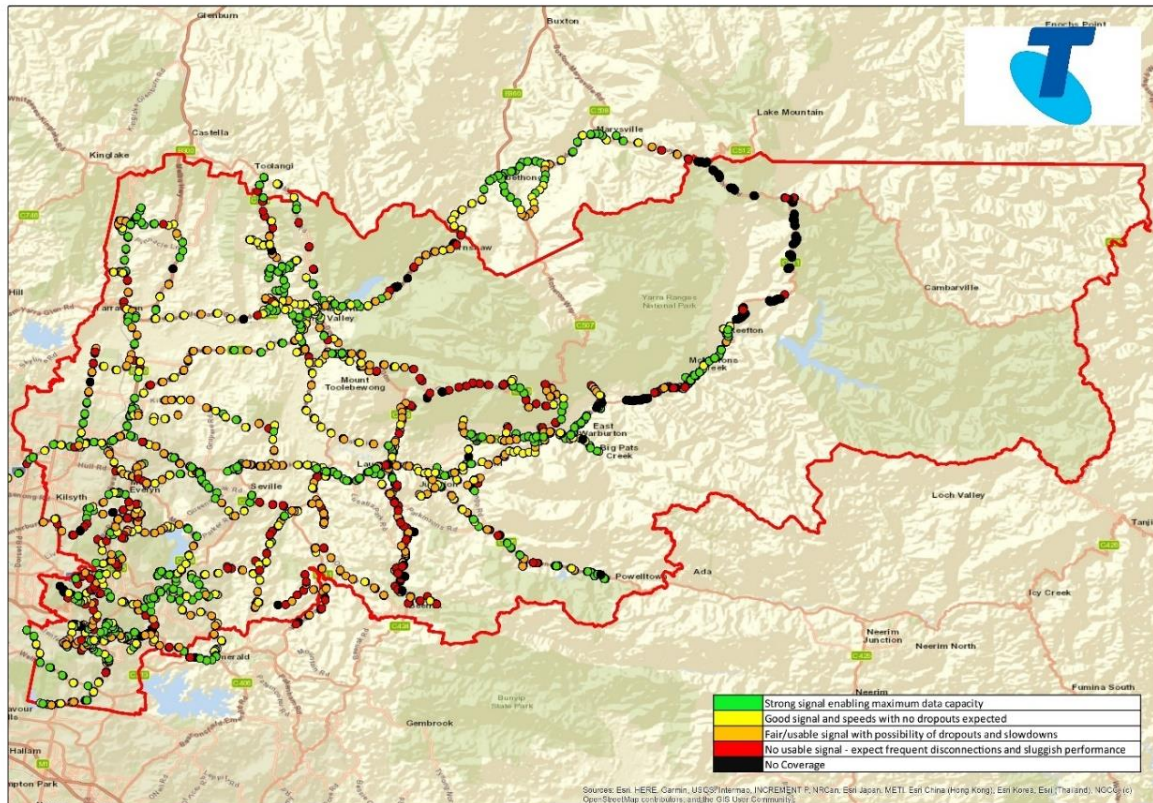

Figure 36 – Telstra 4G network quality

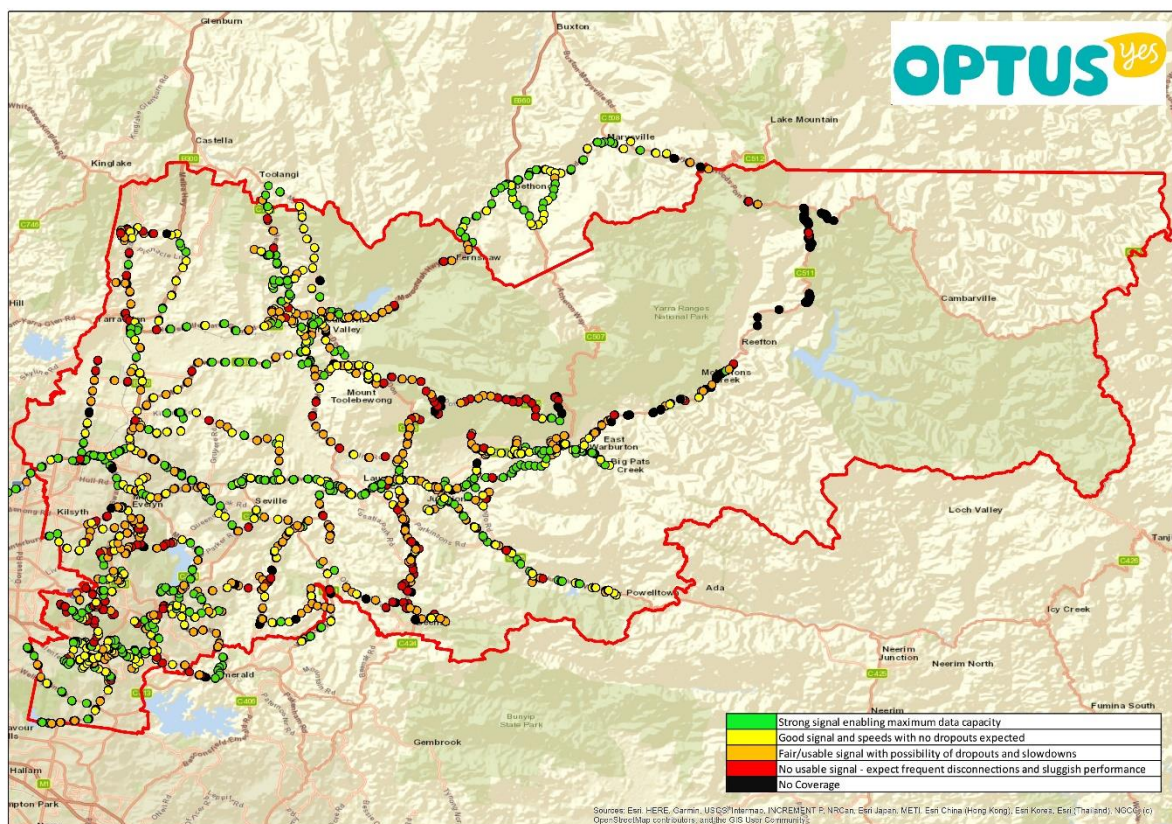

Figure 37 – Optus 4G network quality

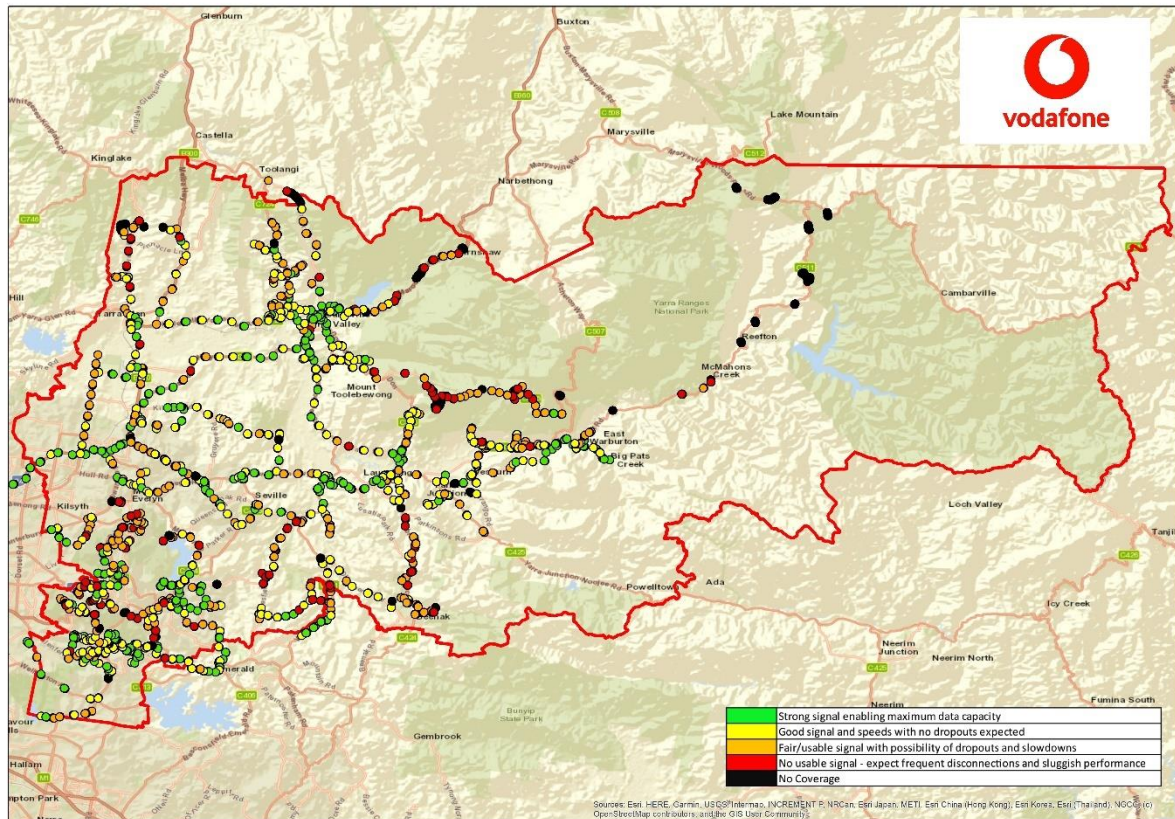

Figure 38 – Vodafone 4G network quality

11.1 Water Tank Coverage

Yarra Ranges requested that testing was undertaken at all council owned firefighting water tank locations. Due to restrictions such as road works, closed roads, dangerous road conditions, some water tanks could not be accessed. Of the water tanks tested, 24% (18) had unusable or no coverage. The list of the coverage for all water tanks is listed in

Appendix 17 – Water Tank Coverage.

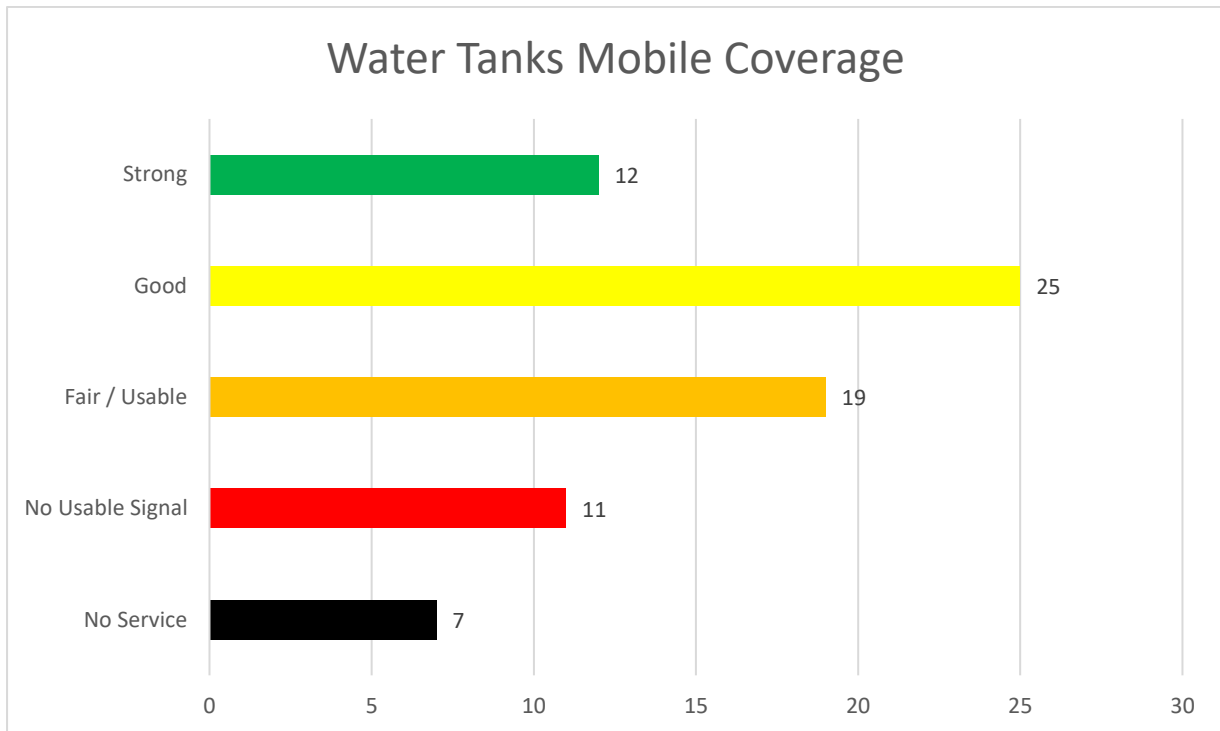

Figure 39 – Water Tanks Mobile coverage results

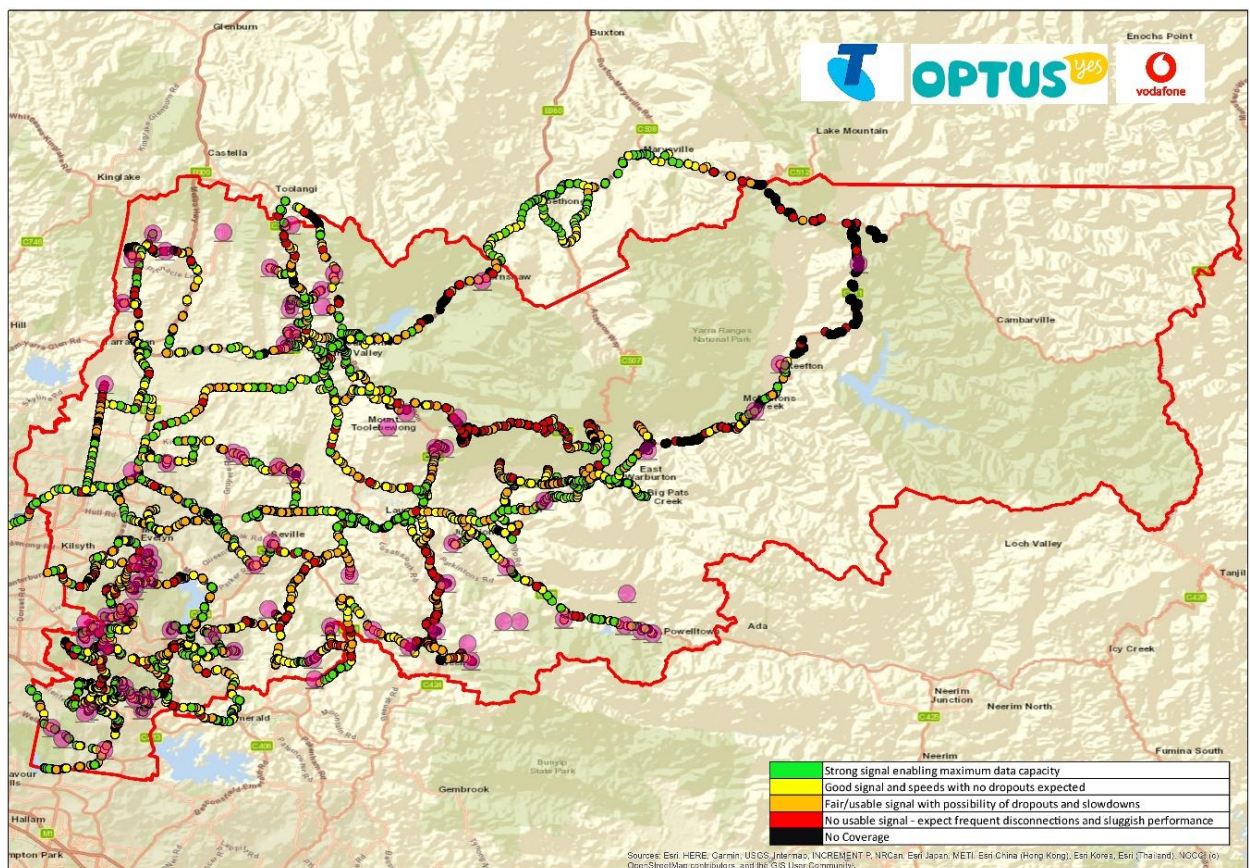

Figure 40 – Water Tanks Mobile coverage map

11.2 Emergency Marker Coverage

Yarra Ranges requested that testing was undertaken at all emergency markers located on the road network within Yarra Ranges. Due to restrictions such as road works, closed roads, dangerous road conditions, some emergency markers could not be accessed. Emergency markers that were not located on a road network (such as walking tracks) were not tested due to limited accessibility. Of the emergency markers tested, 23% (12) had unusable or no coverage. The list of the coverage for all emergency markers is listed in Appendix 18 – Emergency Marker Coverage.

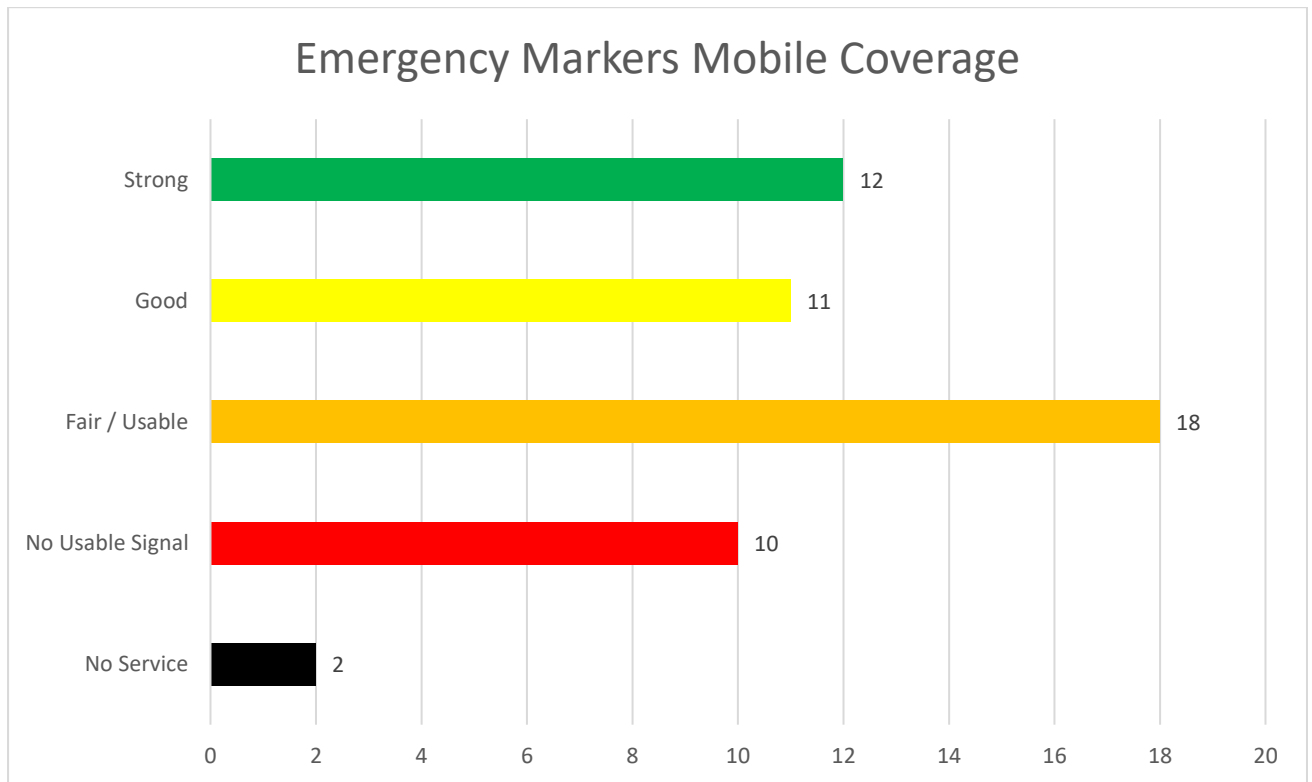

Figure 41 – Emergency Marker Mobile coverage results

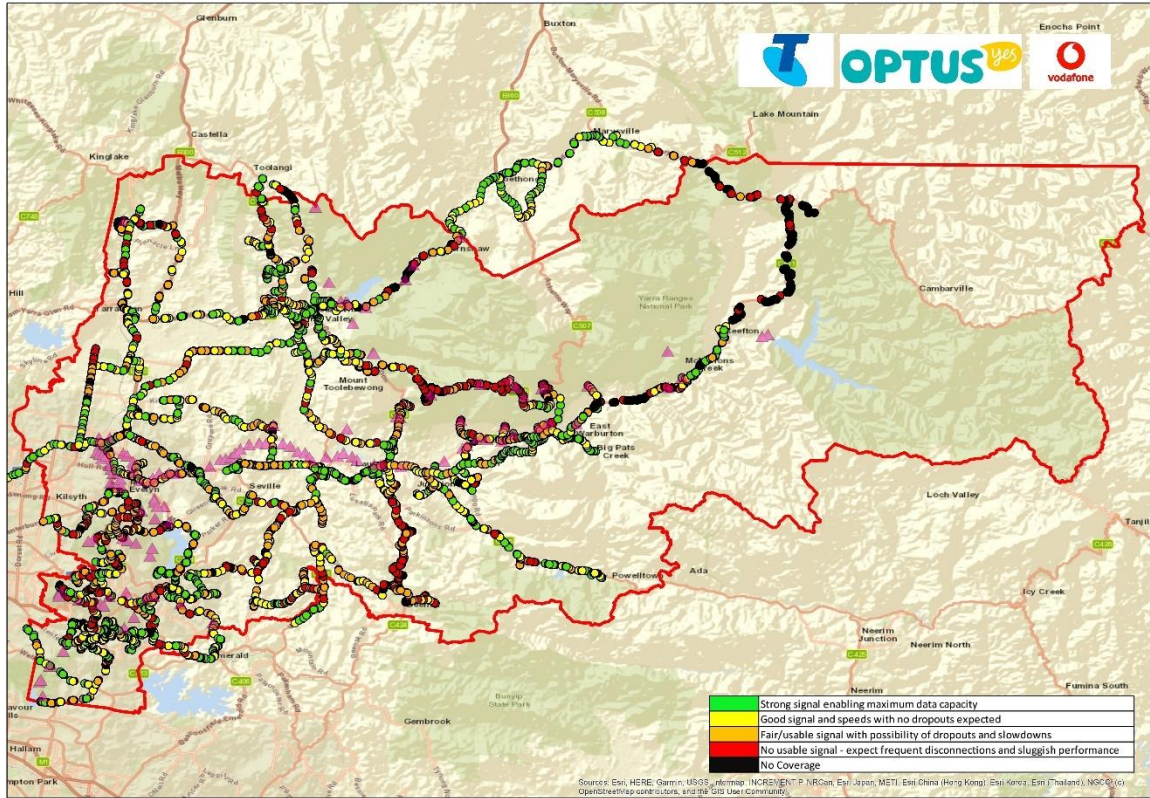

Figure 42 – Emergency Marker Mobile coverage map

11.3 Other POI Coverage

Yarra Ranges requested that testing was undertaken at all other POI's located on the road network within Yarra Ranges. Due to restrictions such as road works, closed roads, dangerous road conditions, some other POI's could not be accessed. Of the other POI's tested, 9% (10) had unusable or no coverage. The list of the coverage for all other POI's is listed in Appendix 19 – POI's Coverage. All Community Fire Refuges and Neighbourhood Safer Places have usable coverage.

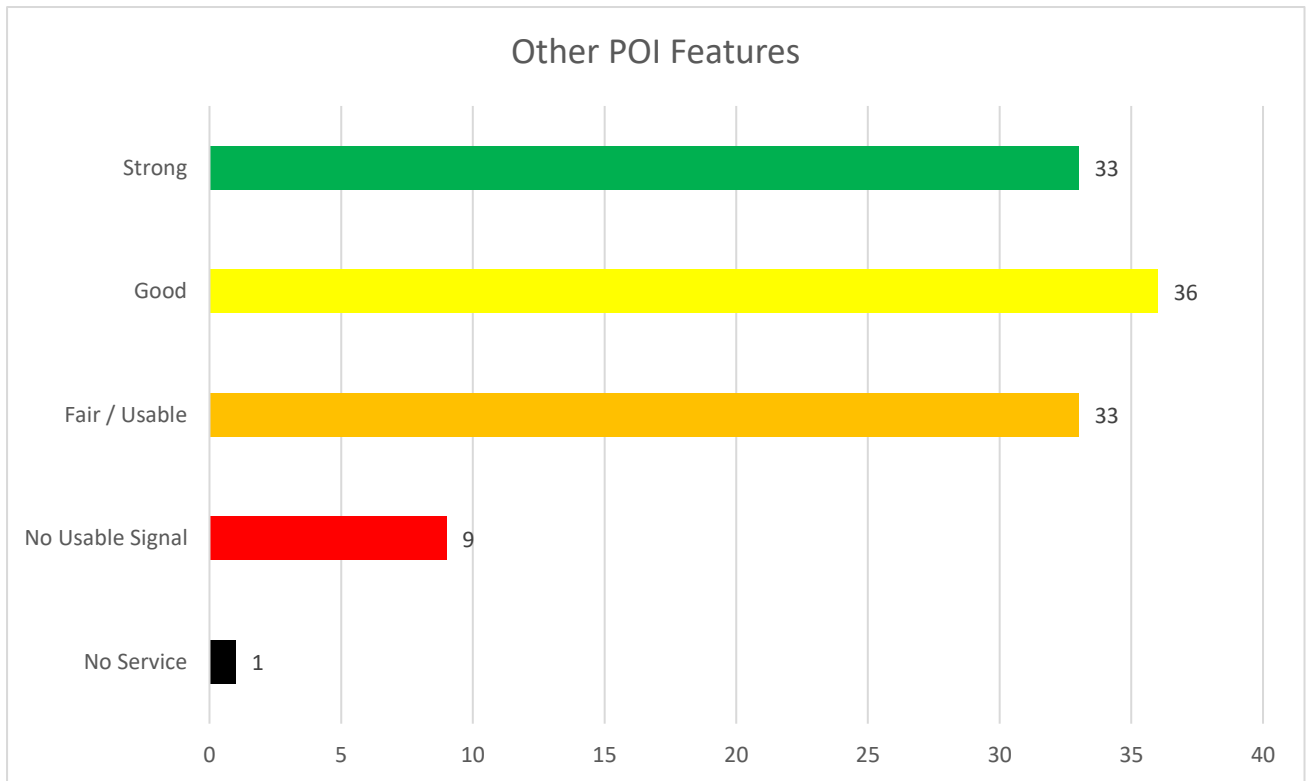

Figure 43 – Other POI Mobile coverage results

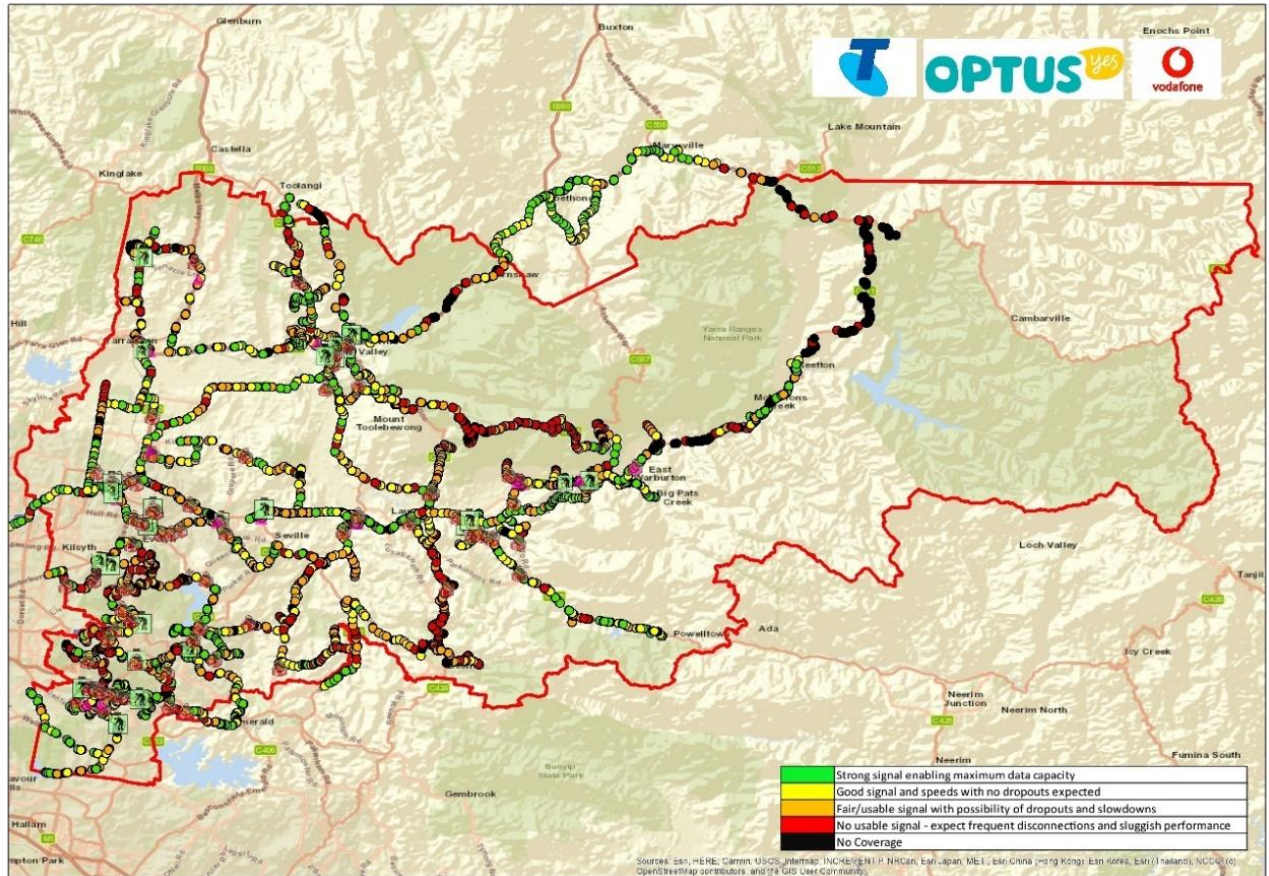

Figure 44 – Other POI Mobile coverage map

11.4 Bus Stop Coverage

Yarra Ranges requested that testing was undertaken at all bus stops located on the road network within the non-metropolitan locations in Yarra Ranges. Due to restrictions such as road works, closed roads, dangerous road conditions, some bus stops could not be accessed. There was a total of 493 bus stop locations tested. Of the those tested, 10% (47) had unusable or no coverage. The list of the coverage for all bus stops is listed in Appendix 20 – Bus Stop Coverage.

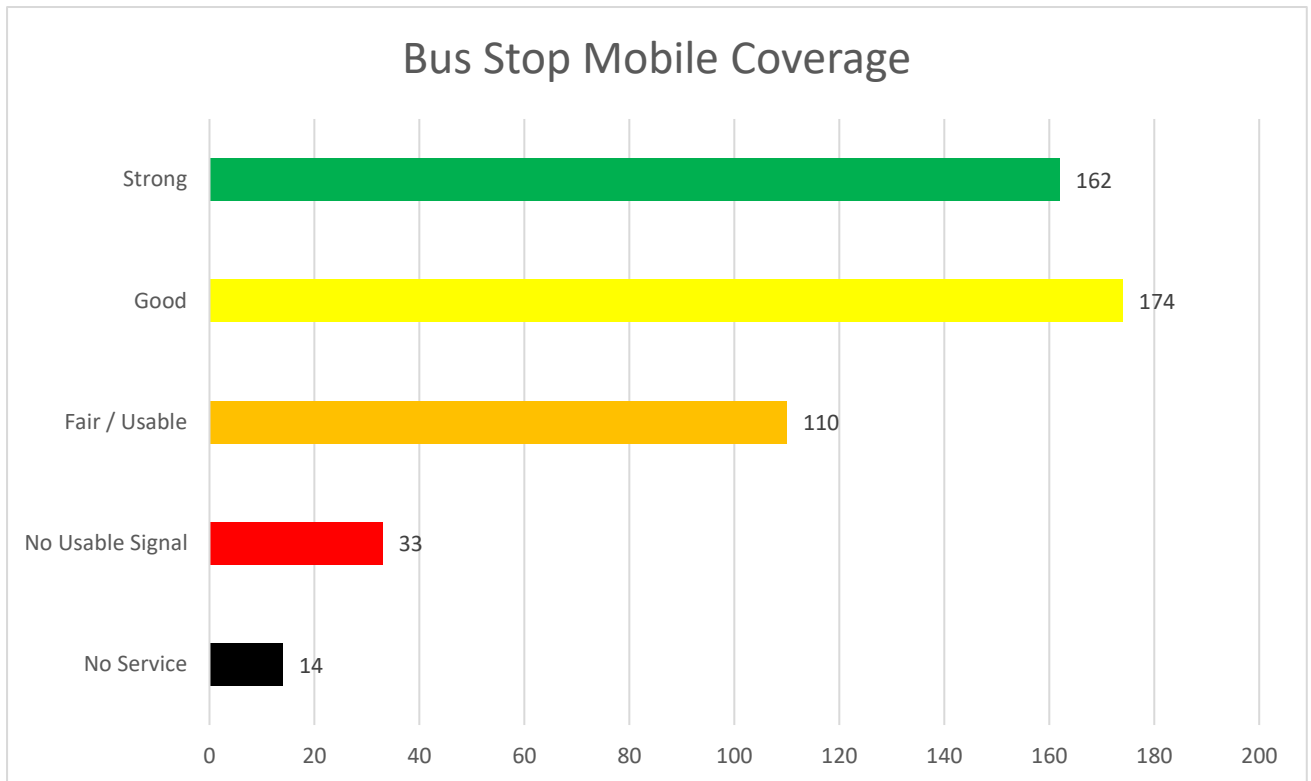

Figure 45 – Bus Stop Mobile coverage results

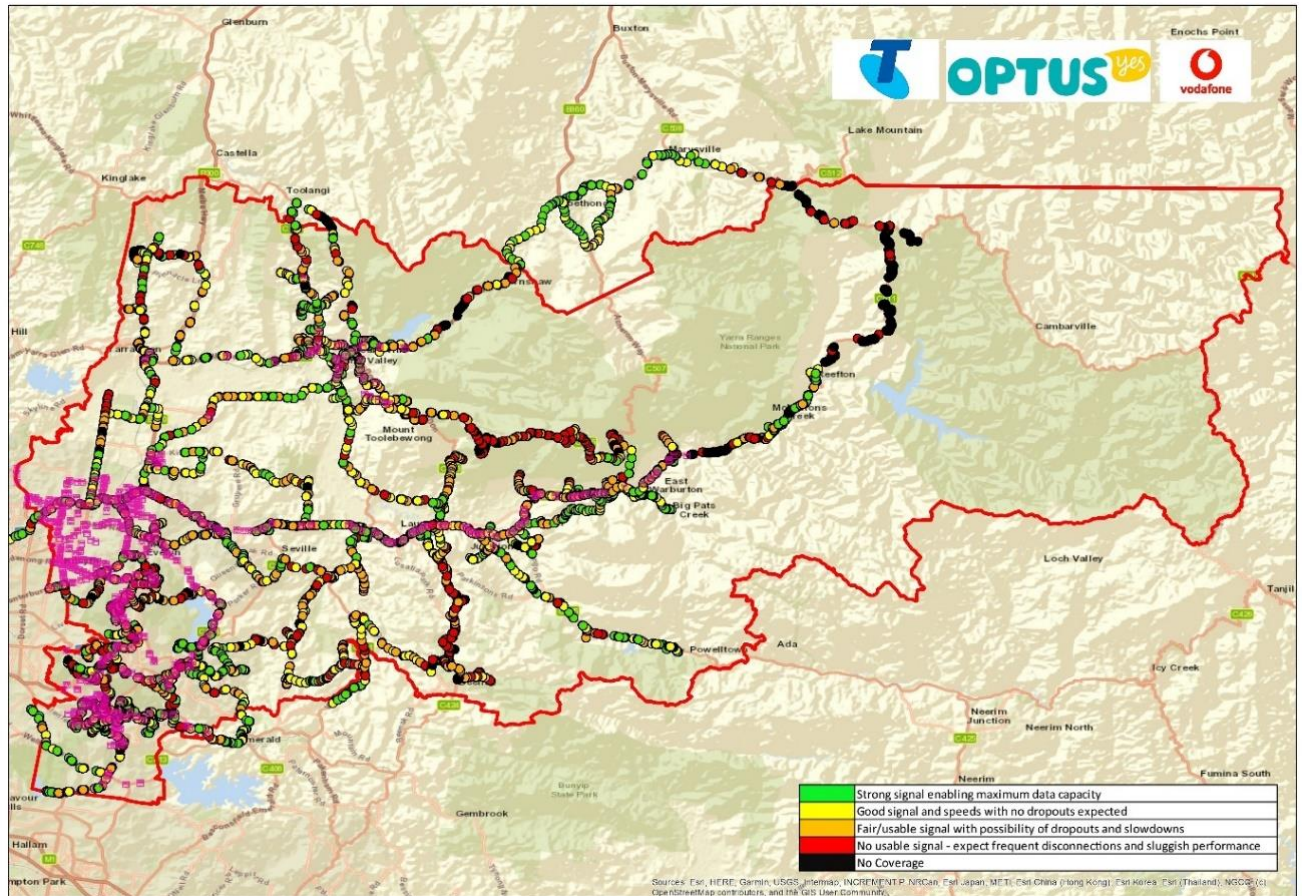

Figure 46 – Bus Stop Mobile coverage map

11.5 Road Network Coverage

Yarra Ranges requested that testing was undertaken on the Yarra Ranges Road network as detailed in section 10.2 - Yarra Ranges Priorities & Study Area. Approximately 2,252 km of the network has been covered. A near field GIS analysis was undertaken to identify the network quality for each road segment from the Lands Victoria TR_ROADS (Road Network - Vicmap Transport) data set. The near field analysis used the closest test marker point within a maximum of 50 metre radius from the road segment.

There were 4,178 road segments analysed using the near field method. It is important to note that road segments are between 500m to 5km in length in the Yarra Ranges areas, but possibly over 5km in length in isolated areas with uniform conditions.

Of the road segments tested, 15% (639) had unusable or no coverage. The list of the coverage for all road segments is listed in Appendix 21 – Road Network Coverage

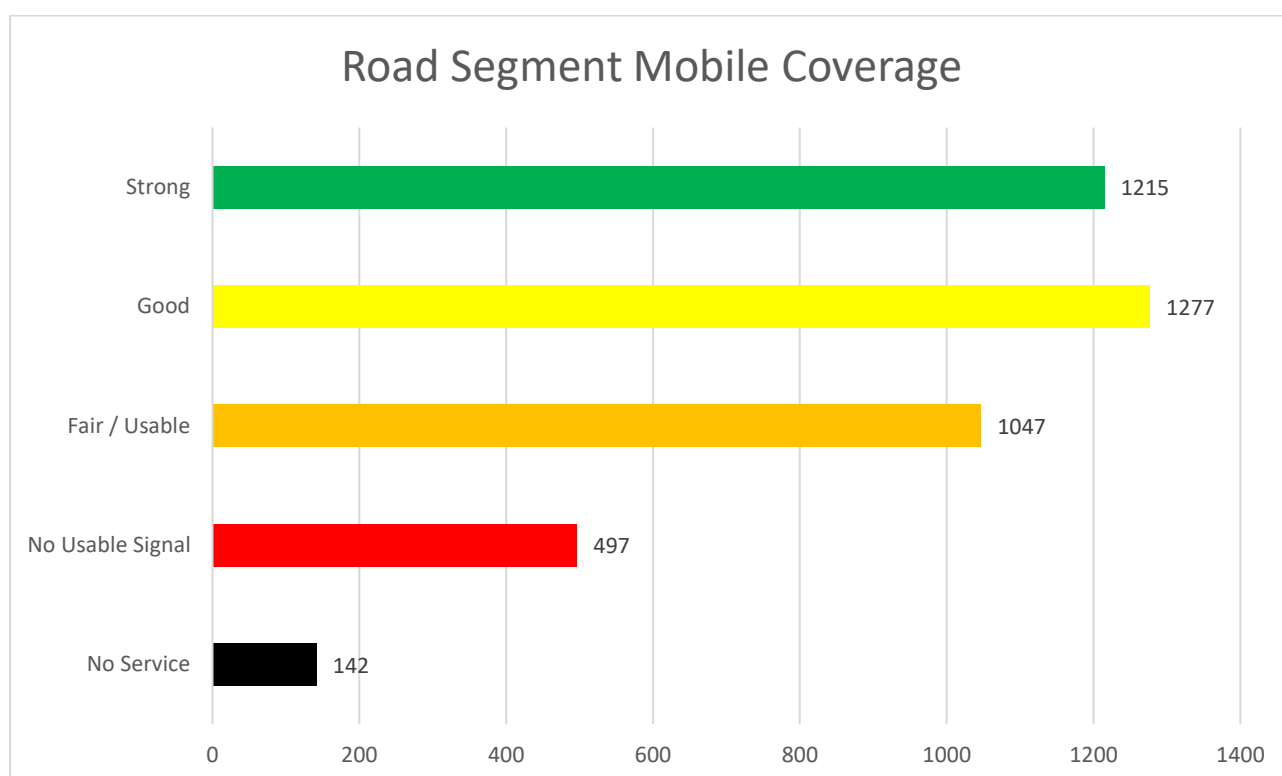

Figure 47 – Road agent Mobile coverage results

Based on these results, Optus had the highest usable (strong, good, fair/usable) road segment network quality result at 78% followed by Telstra at 73%. Whereas Vodafone only had 56% usable network quality on the road network. This result may be indicative of a higher proportion of Telstra subscribers in the Yarra Ranges, hence reducing capacity and quality from the network.

14. Telecommunication Network Risk and Resilience

Telecommunications infrastructure is extremely vulnerable to mains power outages. These telecommunications infrastructure networks, and sites, require concentrated power systems to deliver the demands of their respective infrastructure needs. Additionally, many sites also require power for building heating, cooling, and humidity control equipment to keep them operational.

These power vulnerabilities pose a significant risk to users, particularly those in remote or rural areas, or with critical personal safety devices.

Natural disasters such as bushfire and severe storm events pose significant risk to power infrastructure that services critical NBN and mobile phone networks.

On Wednesday 9 June and Thursday 10 June 2021, parts of Victoria experienced a severe weather event with strong winds and heavy rains, causing trees and power lines to fall and several rivers to flood. Severe weather, including torrential rain, snow, and strong winds of over 120 km/h (74 mph) lashed Victoria. The Yarra Ranges Council municipality was one of the state's most impacted areas. The event prompted evacuations and rescues across the state while downed power lines left more than 54,000 homes without electricity²⁷. By Friday 11th June, there were over 14,000 customers (households and business) in the Yarra Ranges that had suffered ongoing power outages. Refer to Figure 48 – Yarra Ranges storm event power outages 11 June. As a result, all localised NBN and mobile phone communications services suffered prolonged network outages.

While it is still unknown how many mobile phone towers suffered direct damage from the storm²⁸, it is estimated more than 90% of the communication outages were directly caused from the power outages.²⁹ The power outages extended well over a two-week period, with more than 700 customers still without power on the 23 June. Refer to Figure 49 – Yarra Ranges storm event power outages 23 June.

The June storm event in the Yarra Ranges exemplifies the risk to critical communications infrastructure such as the NBN and mobile phone networks, from severe weather events and natural disasters. These outages not only pose imminent risk to life (inability to call 000 for immediate assistance), but impact the recovery process and ongoing business continuity, causing local economic harm and disadvantage.

Based on the scientific evidence now available, it is clear that human-caused climate change has already influenced various weather and ocean hazards in Australasia. Scientific research has established that human-caused greenhouse gas emissions are the primary cause of climate change including long-term trends such as global warming and rising sea levels. Increasing atmospheric greenhouse gas concentrations into the future will continue amplifying many weather and ocean hazards. These will lead to extreme heat events, extreme rainfall and storms, bushfires, and flooding.³⁰

²⁷ <https://www.emv.vic.gov.au/news/assessing-the-damage-to-homes-in-victoria>

²⁸ Carriers are not obligated to publicly report outages.

²⁹ Based on recent events like the 2020 bushfire, Black Saturday bushfires and Hurricane Katrina (USA), communication outages as a direct result of site damage usually equate to under 10% of total site outages.

³⁰ AFAC Climate Change and Disasters, Key Messages and Resources | November 2020, P 5

Based on this risk profile it is encouraged that Yarra Ranges Council undertake direct advocacy to ensure critical communications networks are hardened, to ensure power resilience, backhaul links are provided underground or utilise resilient wireless technologies, and the NBN network supports power resilience to vulnerable communities to ensure an “always connected” community.

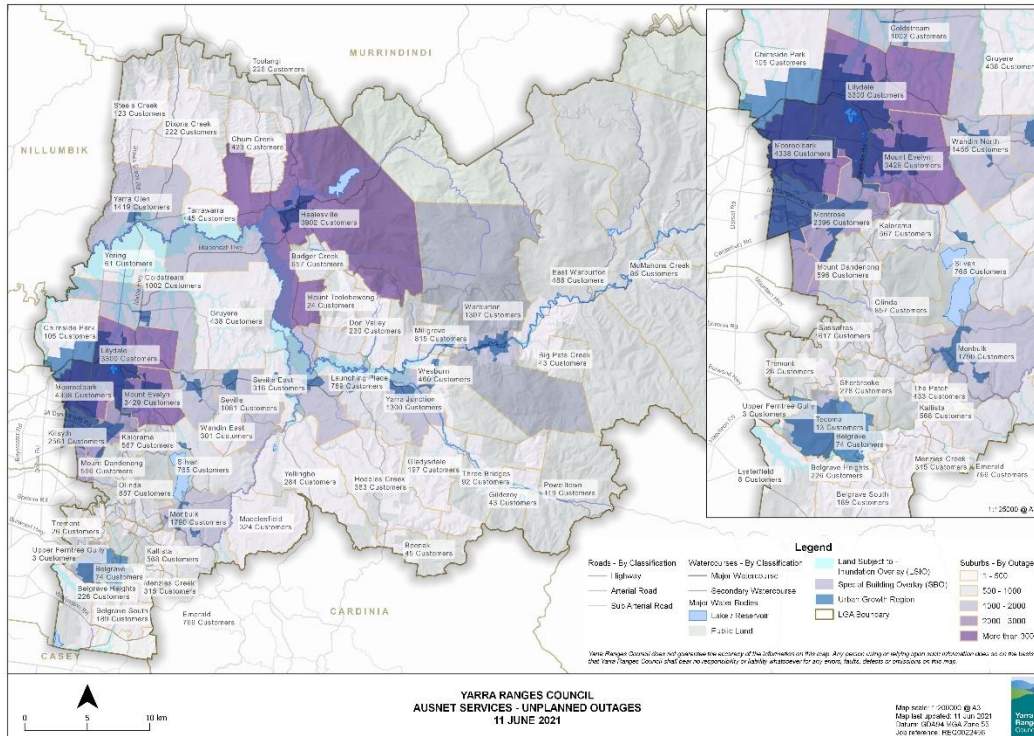

Figure 48 – Yarra Ranges storm event power outages 11 June

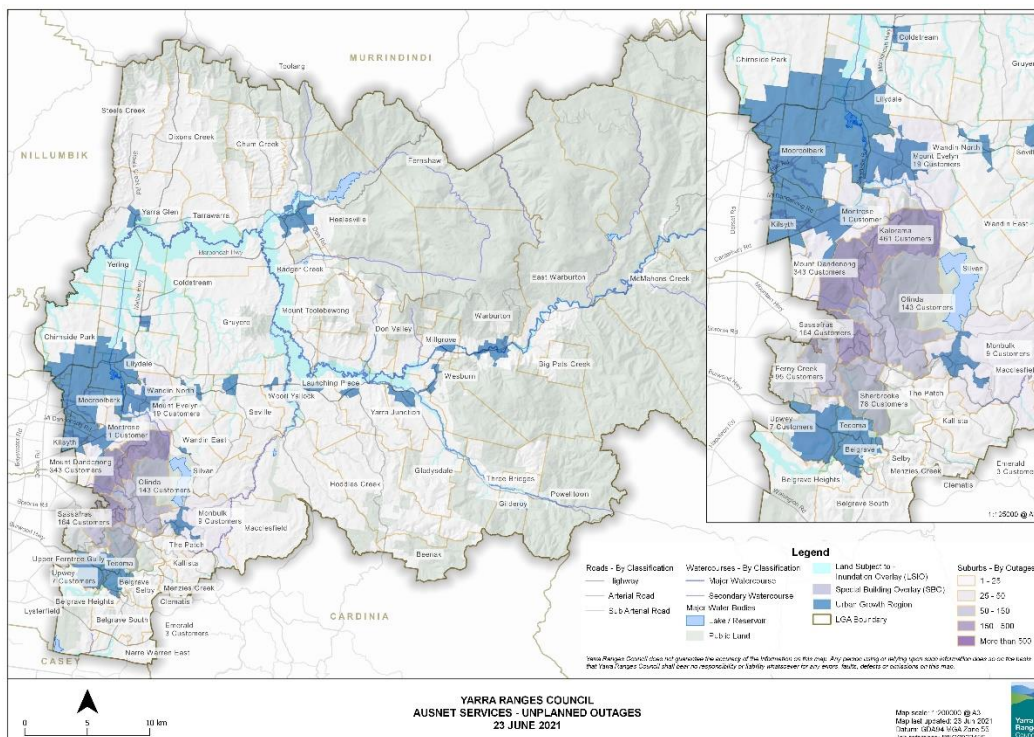

Figure 49 – Yarra Ranges storm event power outages 23 June

14.1 NBN Power Risk and Resilience

One of the most significant risks of the NBN fixed broadband network is that any equipment connected via the NBN broadband access network **will not work** during a power outage. The following list details how each form of technology used in the NBN Multi Technology Mix (MTM) is affected by mains power outages.³¹

Fibre to the Premises (FTTP)

In the instance of NBN Fibre to the Premises, NBN supplies and installs a connection junction within the home or business. This junction requires power to operate. The retail internet provider may supply a **battery back-up** as part of the Power Supply unit; however, this is not standard in all installations. The telephone component (if connected) will require a device that is not mains powered, like a cordless phone, to operate in a power outage, providing there is battery backup on the FTTP system. Information on FTTP battery back is available at the NBN [website](#).³²

NBN Fibre to the Building (FTTB)

Landline phone and internet services **will not work** in the event of a power outage within the Fibre to the Building network or within your premises. Using battery backup or other alternative power options is not possible if the NBN FTTB network is also experiencing a power outage.

NBN Fibre to the Curb (FTTC)

Landline phone and internet services **will not work** in the event of a power outage within the NBN Fibre to the Curb network or within your premises. Using battery backup or other alternative power options is not possible if the NBN FTTC network is also experiencing a power outage.

NBN Fibre to the Node (FTTN)

Landline phone and internet services **will not work** in the event of a power outage within the NBN Fibre to the Node network or within your premises. Using battery backup or other alternative power options is not possible if the NBN FTTN network is also experiencing a power outage.

NBN Hybrid Fibre Coaxial (HFC, also referred to as 'cable')

Landline phone and internet services **will not work** in the event of a power outage within the NBN HFC network or within your premises. Using battery backup or other alternative power options is not possible if the NBN HFC network is also experiencing a power outage.

NBN Fixed Wireless (FW)

Landline phone and internet services **will not work** in the event of a power outage at the NBN Fixed Wireless tower, fibre network or within your premises. Using battery backup or other alternative power options is not possible if the NBN Fixed Wireless tower is also experiencing a power outage.

³¹ <https://www.nbnco.com.au/learn/what-happens-in-a-power-blackout>

³² Battery Backup information: <https://www.nbnco.com.au/learn/network-technology/fibre-to-the-premises-explained-ftp/battery-back-up-information>

NBN Sky Muster satellite

In the event of a power outage at your premises, using battery backup or other alternative power options will usually allow you to reconnect to the NBN Sky Muster satellite service. However, if one of the NBN Sky Muster satellite ground stations is also experiencing a power loss, there may be further delays in reconnecting your service. This is unlikely, however.

If the premises are located within a Fixed Wireless and Sky Muster satellite area, there may be the option of retaining the existing landline phone service active across the copper network. Traditional copper landlines provide a significantly high level of resilience to power outages, providing the telephone component is connected will require a device that is not mains powered, like a cordless phone.

In May 2020, the Federal Government announced that under the Strengthening Telecommunications Against Natural Disaster (STAND) program, \$7 million will be spent to install 2,000 NBN satellite services at rural and country fire service depots and designated evacuation centres, with 100 sites to receive batteries and solar panels. In addition, a community resiliency program of \$2.1 million would be spent on an information program over the following two bushfire seasons to promote "practical information and advice for communities and businesses about how to keep connected during emergencies".³³

Medical Alarms

The NBN provides a Medical Alarm Register. Any persons using the medical alarms on the NBN are encouraged to register those devices and usage with the NBN as system resiliency options can be discussed. However, it is important to note that this register will not guarantee these devices will work in a power outage.

14.2 Cellular Telecommunications Risk and Resilience

In Australia, most mobile phone towers are in an unhardened state. Site hardening refers to the collection of tools, techniques, and best practices to reduce vulnerability at mobile telephone sites, including battery systems, infrastructure and backhaul. This state allows the provision of up to 3 hours of battery back up to that mobile phone tower and equipment in the event of a mains power outage. In addition, recovery, and the charging of those batteries after a power outage event may take up to 24 hours to charge to a full state to be used again.

The decision on tower hardening is made solely by the respective cellular telecommunications carrier themselves. The risk of mobile phones towers failing due to power outages during emergencies is an extremely high risk to vulnerable communities.

A report from the Australian Communications and Media Authority (ACMA), in May 2020, examined the causes of mobile tower outages from 19 December 2019 to 31 January 2020, during the bushfire peak. Loss of power was the main cause of outages, being responsible for 88% of all outages over this period. Only 3% of mobile tower outages were the direct result of fire damage. Of the 1,390 total facilities that were impacted by the fires, only 1% of incidents were a direct result of fire damage.

³³ <https://www.zdnet.com/article/australian-telco-networks-to-get-au37-million-disaster-resiliency-boost/>

As a response to the ACMA report, in May 2020, the federal government announced a \$37.1 million campaign program, Strengthening Telecommunications Against Natural Disaster (STAND), to improve the resiliency of the nation's telecommunications infrastructure. The program was broken down into four parts, with the largest portion allocated towards upgrading battery backup power at mobile base stations under the Mobile Network Hardening Program name. A total of \$18 million was spent on the hardening program, which includes \$10 million from the Mobile Black Spot Program.

Mobile phones towers (base stations) funded under the first two rounds of the blackspot program would have backup power duration extended from 3 to 8 hours to at least 12 hours, if possible. A grant program was also created to fund 50% of the capital expenditure for upgrades at high priority locations and could include backup power or hooking up redundant backhaul at towers and exchanges.

However, these decisions on hardening were still under the control of the respective telecommunications carriers, and the Department of Communications hardening guidelines were advisory not legislative.

Many regional communities have taken the lobbying for hardening into their own hands. Successful lobbying efforts by the Resilient Communities Adelaide Hills Group³⁴, forced the realisation of a private members bill for the Guaranteeing Mobile Phone Service in Bushfire Zones³⁵. However, the bill was not passed by the government.

The hardening of mobile phone towers is a complex and complicated issue, particularly as the main driver for the three cellular telecommunications carriers is an economic one.

When working with the carriers, a collaborative approach is encouraged. The complexities that can be overcome using a collaborative model between the carriers and council, can assist to streamline planning and permit processes for new communications sites. This approach should not solely be limited to mobile phone towers but can include backhaul pathways and system power resilience.

It is also encouraged that the Yarra Ranges Council:

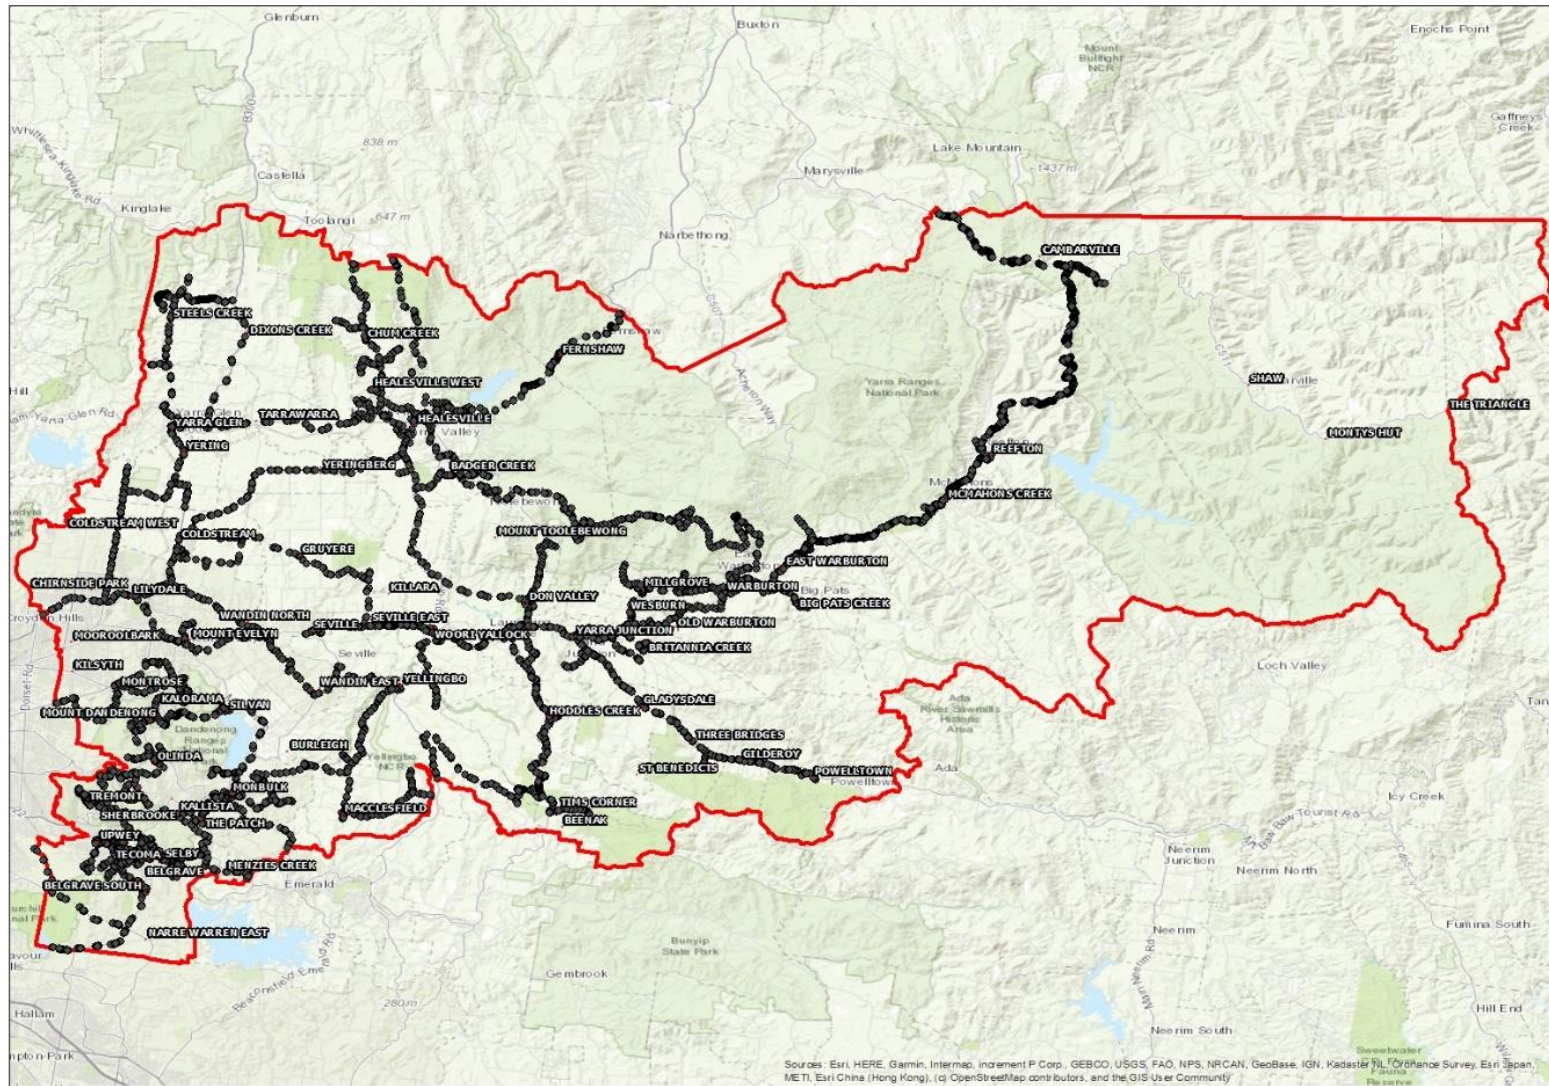

1. join the national conversation pushing carriers to provide coverage for vulnerable communities and disaster-prone areas, especially as the 5G rollout will reduce coverage footprint.
2. advocate for policy and legislation change.
3. advocate for changes to the MBSP criteria.

Although ensuring coverage is the driving criteria for the MBSP, Yarra Ranges Council should be advocating to ensure system and site resilience is promoted amongst the carriers to ensure communities are not left vulnerable and suffer communications outages when they are needed the most.
